Interesting.

I worked for a calibration laboratory that worked lots of portable battery powered equipment. We used alkaline batteries in nearly everything, about 3 cases a month (48/case I think). At one time we kept batteries in the refrigerator until OSHA required food and batteries not be stored in the same unit.

We contacted one of the battery manufactures and asked about cold storage. We were told don't do it, there wasn't enough life extension to bother with it. By contract, all of our batteries had to be date coded with date of manufacture as we were only allowed to leave them in an instrument for 6 months. Batteries replaced due to date code requirements were load tested and good ones used as flashlight batteries.

The Low-Power AM station hobby has become more popular over the past 2 years.
In the U.S, it is legal to broadcast over the AM band 540kHz-1700kHz using a 3
meter antenna and a 100mW transmitter.
Until recently, building a small AM radio station was very complicated and very expensive, until now.
Using a SSTRAN AMT-3000 transmitter, which comes as a kit for under $100.00US, or a built version which comes assembled and tested for under $200.00 US, and a 3 meter, coil loaded and tunable antenna for around

$225.00 US, anyone can get on the air right now!

I get questions about range: the system I am describing has had reports from 1/2 mile to over 4 miles! Range totally depends on these factors: location, scope of the land, conductivity, choice of frequency/adjacencies, and use of this antenna.

If the transmitter and antenna are installed correctly in a proper area, several miles are possible. Many people are interested in a good, solid local signal and this system does it for a fraction of the amount of money you will spend for a comparable system.

If you are interested in low power AM Broadcasting, I invite you to visit this site:

http://antenna18431.tripod.com/antenna.htm

In this site you will find information on the 3 meter antenna, pictures of it, information and pictures of the transmitter and a link to email questions, comments and inquiries to.

If you would like to be on the air, this is an excellent choice to do it well, and at a very affordable price!

I installed, configured, and got up and running with AGWPE Packet Engine (and it's client AGWTerm), Multipsk, POC32, Digipan, MixW2 and a host of lesser applications purported to be capable of decoding digital signals of one format or another. Then I systematically scanned the spectrum from 530khz to 1ghz (minus a few chunks) and found a total of 20 - 30 clear, non-voice, data signals of one type or another which I fed into my soundcard's 'line in' receptacle, with these applications running. I know the input was going where it was supposed to because the waterfall display showed the various signals as they beeped, warbled, and chirped. Sometimes, when Mixw2 was in certain modes, garbage would appear, but after all of that time and effort with all of those applications, not even ONE signal got decoded. I listened to samples of digital signals on a website and I was certain that I had found pager signals, but POC32 didn't think they were pages. I tuned into the national APRS uplink channel and I could hear what sounded like mobile APRS stations uploading their little frames of data, but WinAPRS wouldn't decode them.
What's my point in all of this? If there's anyone else out there who's thinking to themselves, "Boy, that digital radio idea seems interesting, why, maybe I'll just down load some of those applications sometime and decode some digital signals." Don't be so sure. Yes, all of those applications CLAIM to be able to decode the right kind of digital signal, but I tried every data signal, on almost the whole radio spectrum, and I tried each signal with each mode-setting on each of those applications, and it didn't work for me, not even once --- maybe it only works for certain people.

There's a guy within 2m range of my location who's making interfering transmissions and not identifying himself, and just generally being an idiot. For instance, 2 licenced operators will be talking about a problem one of them is having with antenna baluns or something, and this individual will cut in with a comment like, "They're giving licences to anyone these days --- if you can't even run a radio ...", and then he's gone. I'm new to this. I just got my licence last week, but I know it's possible to DF a radio signal. I've been listening to this guy for weeks. If Industry Canada has more important things to do, then how about farming out the job to some volunteers. All it would take is to localize him to where he lives, and knock on his door and let him know someone knows who he is. There's no way he's sophisticated enough to move from place to place to evade a sweep. I'll bet we wouldn't even need to take the radio away --- just let him know someone is on the case and he'll pack it in. I'm sure this is a situation that happens over and over, though, what's the usual method of solving it?

It is for any country that has an IRLP node, not just the USA and Australia.

It is called the "1st Aussie-American IRLP Contest" because of the Australian Club & US Club sponsoring it. Some web sites have been updated to read "1st International IRLP Contest"

There's plenty of UK nodes in the contest, the list is on the website

Not my LOCAL Node

Local OP says there's enough contest on HF where SOME SKILL is needed and says he's on holiday until the end of April.

To have contest on TWO DAYS a week is TOO much , for SEVEN Days its insufferable.

Cheers

DieSea

I don't understand why cell phones aren't included.

They should be , after all they can be used to control an EchoLink or IRLP Node .

I Should also add that this contest is on for a FULL MONTH , that's a full 28 days or more .

If I remember MattD had some suitable comment a day or so back.

There would be no reason why you can't use CW over IRLP. Stop bagging
IRLP, if you don't like it then don't use it!

WAKE UP! There are so many different things you can do on Amateur
Radio, there is room for everyone.

I just checked, there are a total of 1591 IRLP nodes, 1034 active, 879
idle and 105 in calls. This indicates the following to me:

1. IRLP is a popular way of communications on Amateur Radio.

2. This contest is going to have very little impact on any one local
node. Big deal someone is going to dial it up, put out a call either
they will make a contact or they won't and then they will close the link!

Get over it! Go back to your CW if you want, who bothers you or bags you
for using it, I know I certainly don't.

Simon
```

I'm not bagging IRLP or Voip

A contest running for 24 hours perhaps or at a push 1 weekend but 24 / 7 for 28 days no way.

Ofcom / the RSGB have put in the conditions of issuing a Notice of Variation , that the holder of the Nov MUST be on site at all times the node is running , if he's not then the can rescind his Nov if caught.

I would be surprised if any UK amateur providing a VoiP Gateway would be at home for 24 / 7 for 28 days .

It there fore puts the UK amateur at a dis-advantage as soon as the licensee walks of the property , the node should be turned off.

WAKE UP!  You *MUST* use your radio, the person at the other end *MUST*
use their radio.  Last time I checked that was Amateur Radio.

Like I said before there are *MANY* parts to our hobby, I don't knock
what you do in Amateur Radio, so leave people alone that like IRLP.

Without new innovations in Amateur Radio we will not get new people into
the hobby.  If we don't get new people into the hobby then Amateur Radio
will die a natural death and then we will have to find another hobby!

I certainly wouldn't expect anyone to go against the regs. But what has
that got to do with the IRLP contest?  My point was with so many active
nodes out there the load would be spread out and traffic I would expect
be very minimal on any given node.

It certainly doesn't make the "PLAYING FIELDS LEVEL"

Our local Node op has been away this weekend helping at the Blackpool Rally so his nodes been down since Friday , its just gone up.

In some respect we're lucky as he's an elderly bloke with mobility problems , he doesn't get out much , so when he's up its on , he's still p***ed off with this 24 / 7 x 28 day contest .

The Next comment you make is that its radio to radio , that's not 100 % correct , I know of at least 3 VK's , 2 VE's and at least 5 G / M stations that don't have a radio connected to their node . Its quite easy to confirm that comment about G / M stations if you know where to look.

DieSea.

Are you sure you are not confusing IRLP with echolink? I personally
don't agree with using your computer to access the the network like
echolink does, but I am not going to stop any licensed person from doing
so if the regs. allow it.

Sorry no, the babies objected strenuously to having their yelling webcast across IRLP. A spokesbaby stated 'Goo goo GAH!!'

Kate vk4xyl :-))

"Diesea" is not confusing anything with anything. He is talking about
IRLP. ie. the system which is supposed to be radio > radio only.

You have a very narrow view of what actually constitutes Amateur Radio.

Brad.

We have our share of trolls here in Toronto. Generally speaking,
thanks to cutbacks IC does dick-all. If you have any buddies in the
RCMP and they are willing to assist you, you can try and get charges
laid but AFAIK only an IC rep or an RCMP officer can enforce IC regs.

Simon

If had meant EchoLink , I would have said EchoLink , you as I were talking
about IRLP and my response was in that vein.

I have been around before the inception of IRLP by Dave Cameron even before the demise of IPhone and the I'll fated ILink.

If you know how to look you will find a number of IRLP nodes on air in the UK that CAN NOT be attached to a radio.

DieSea.

Might be interesting:
www.qso.nl/instruction.htm

is selling a DVD with over 1100 hamradio manuals.

Mainly old stuff, but some "hard to get" manuals.

73's

Thanks Chris

As for EchoLink and its "USERS" (Please Note the words Users and EchoLink) I Wonder how many "ON AIR PROVIDERS" are heartily fed up with a USER connecting with out identifying and then disconnecting after 5 minutes and still have not identified .

I KNOW several UK EchoLink on air providers where USERS are banned with certain exceptions , one is a VK4 , a very pleasant "OLD GENT" of 85+ that Chris and I have known for years.

Sorry to Hi-Jack your reply Chris .

OK, I stand corrected there. In that case I am surprised Dave allows
them on the system as I understood the philosophy behind IRLP was to
USE the radio.

I am hopefully setting up a node for my local club later this year and I
have *NO* intention of operating it from the console, if or when I do
use it, it will be via a *RADIO* the way it is meant to be.

Another moron on my shit list! Ignorance.

Just because I don't work CW doesn't mean I want it banned, in fact I
would like to see CW allocations retained as it is a valid an historical
part of our hobby. Just as IRLP is valid and *NEW* part of our hobby.

No doubt similar utterances were made when spark transmitters were phased out.

Technology moves on, that is the nature of things. No one is forcing you to use ILRP or any of the other modes.

Thanks for bringing this up Mate!.

My major problem is folks refering to interconnecting "hams" over the internet as "ham radio".   Ham radio is R A D I O . Not INTERNET connected to Nodes then to a radio somewhere. Call it whatever you want, but it is NOT ham radio.

Dan/W4NTI

Missed the point there Brian, Dan is complaining about what the mode is
called, not the fact that it exists..

I fail to see the difference between using an FM repeater that is linked to another repeater on a different band, which is commonly done, and using IRLP.... Yet using the repeater is perfectly acceptable?

IRLP is, usually, vastly different than EchoLink.. If stations at both ends are using radio, then does it really matter how the link between is established? Using linked repeaters is fine, some of which use links outside amateur bands, yet nobody here is suggesting that we put crap on those operators!

Yes, DX contacts via HF are nice, and may be what many consider to be true amateur radio, but not everyone can get on HF bands and if IRLP helps increase activity on radio bands then how can it be a bad thing?

I do, however, agree that a 24/7 contest for a whole 28 days is starting to get a bit much! 24/7 for 1 or 2 days should be enough, just like most other amateur contests.

Cheers

I dont know alot about this kinda of stuff......and call me an CB idiot if you wish to do so......cause mainly I only deal with CB type stuff.....there are some antennas out there you can track his signal with.....sorta like a "rabbit hunt" if you will....once you find out his pretty close area....then install a small "transmitting bug" for his listening pleasure...LOL

Install a bug? I'm not sure I'm following you. You mean set a jammer? Yeah --- but then he'd just change frequencies (if that was what you meant). How do CB people shut down deliberate interference?

I'll bet there are some interesting stories out there about how this kind situation has been dealt with in the past, like I said, I'm sure this is a perennial issue.

Well at one time around my area.....we had this garbage can called "Big John"......more like a toilet was he......so one day we figured out where he was transmitting from.....his house to be exact.......one night undercover.......with folks who had experience with this kinda of stuff...of course.......we installed "transmitting bugs" so to speak.......they transmitted on one frequency at about 500mW to 1 W off of a 9 volt battery for some time.....not only did we install one under hsi base antenna (home unit) we also installed a couple more on his vehicles in nice, hideable places where he would never know to look....so no matter where he went....for about 2 to 3 months all he heard was this wierd transmission in his radios........found out he was taking all his radios to the shop to see what was wrong with them.....nothing was wrong with them.......we had went to another channel to do our talking.........on the CB band and sometimes to talk about him we went to USB/LSB to talk as well......he still dont know what happened or who did it......since then he moved about 100 miles off from here.....

Here is what the difference is.

There is very little difference between IRLP and people using the internet for making telephone calls.

If a person made a gateway for IRLP using FRS radios, it would be the same thing. For CB radio, same thing.

There are voice chat rooms for people on the internet already. They are probably more reliable than IRLP. THey cut out the weak link - the radio.

The whole setup eliminates every interest and challenge of Amateur radio, except for the talking. There is as much technical acumen needed for me to talk around the world using IRLP as there is for me to pick up the telephone.

> Like I said before there are *MANY* parts to our hobby, I don't knock
> what you do in Amateur Radio, so leave people alone that like IRLP.

Um, no thanks. Seriously, if you want to do IRLP, then have at it. But if you do silly things like have contests, then I think I'll voice my opinion if ya don't mind.

> Without new innovations in Amateur Radio we will not get new people into
> the hobby. If we don't get new people into the hobby then Amateur Radio
> will die a natural death and then we will have to find another hobby!

And here is the real kick. Do you actually *think* that IRLP is some kind of "innovation"? It is the internet equivalent of a phone patch. Like I say, if that is your think, then fine. But to actually have a contest for such things is silly.

Of course, last time I checked, there was no law against being silly! 8^)

     Umm, do we have FM repeater contests?

> IRLP is, usually, vastly different than EchoLink..  If stations at both ends
> are using radio, then does it really matter how the link between is
```

> established?

That depends. The idea of using Handi-talkies to talk across the world by IRLP is interesting after a fashion, but in reality not a lot different than using a phone patch to do the same.

Using linked repeaters is fine, some of which use links
> outside amateur bands, yet nobody here is suggesting that we put crap on
> those operators!

Frankly, although I use FM repeaters of the linked and normal variety, they are only for utilitarian purposes, and really aren't all that much "fun"

> Yes, DX contacts via HF are nice, and may be what many consider to be true
> amateur radio, but not everyone can get on HF bands and if IRLP helps

It is a dilution of Amateur radio.

> I do, however, agree that a 24/7 contest for a whole 28 days is starting to
> get a bit much! 24/7 for 1 or 2 days should be enough, just like most other
> amateur contests.

Under no circumstances is it "like" other amateur contests.

This is what is a little bothersome about the whole thing. For me to participate in an HF contest, (excluding that I have to do this stuff to get on the air anyhow) I need to erect an antenna system that works fairly well, I have to hone my receiving skills so that I can pull weak signals, and to learn general good operating practices.

Now, what do I need to do with IRLP?..........

The bothersome part is that it seems like too many IRLP'ers and Echolinker's, just don't "get " that.

Kindly indicate how IRLP is a moving on of technology?

I can do EVERYTHING that IRLP or Echolink can do by eliminating the silly Handi-Talkie on the end.

It would all work better if the radio part was eliminated.

It is an H-T audio chat room, Dan.

Hah --- good one! I'll bet there's a hundred more out there that are just as good, too. How complicated a deal was it to get position fix on Big John? Was it in the city or the country? With my luck, just as I started to get real strong readings that he's right in front of me I'd look up to see a highrise. Too bad you didn't have a guy in the radio shop in on the play, that way when he brings his gear in to be fixed the problems mysteriously just keep multiplying ...

Up until now I haven't made comment on the contest, that is probably
because I have no real interest at present for contesting, although that
does change from time to time.

I suppose a month long contest is a long time, although I would have
thought that being spread over a large network such as IRLP it wouldn't
have really created a great deal of traffic on any given node.

Besides, how many operators are going to be contesting all month? Most
I would expect will just jump on in their spare time, just as they would
for normal operating.

True, but even a phone patch at one stage in history was popular and they
both still use radio to some degree. Maybe not everybody's 'cup of tea',
but still neither is CW, or SSTV, or RTTY, etc..

I agree, and while I would much prefer to run DX on 50MHz SSB, that isn't always possible so what happens during other times? Do I just switch all the radio gear off and give up, or resort to using repeaters and the like???

>
>> Yes, DX contacts via HF are nice, and may be what many consider to be

>
> It is a dilution of Amateur radio.

Voice was a dilution of Amateur Radio way back in the early days where CW was all the go, yet here we are removing CW from the entrance requirements. Rather than criticise those using IRLP, shouldn't we just 'understand' that maybe they use it for a reason and then encourage them to experiment with other modes??? On the other hand, I know of many long time hams that use HF often for DX contacts, even using CW, but at other times (e.g. when mobile, when portable, or when conditions are very poor) they use IRLP to keep in touch with overseas stations AND encourage newcomers to the hobby to chat with people outside their city....

Erect an an antenna system that works fairly well (depending if you use a repeater or simplex node), learn general good operating practices, get DTMF working on your radio!!!!

>
> The bothersome part is that it seems like too many IRLP'ers and
> Echolinker's, just don't "get " that.

I agree EchoLink is just not amateur radio, although I use it sometimes from inside the house where the XYL wont let me bring my radios! But again, rather than criticise and make fun of their chosen mode, wouldn't we be much better off encouraging the use of other modes????

So you've moved on "even further".

Personally, I like the radio bit and, to me, Echolink (or the other VOIP
systems) aren't "real amateur radio". However, I don't feel the urge to tell
you how you should enjoy your hobby. If Echolink does it for you, please
enjoy the hobby in your own way.

No it does not Brad. It's not the technology it's the terminology.

I choose to use IRLP as it allows me to connect to hams interstate and overseas, until I can get HF gear put up, which seeing as we are moving, not much point until at new QTH later this year. Personally, as a newbie to ham radio, (but long time cb'er and scanner user) it is a great way to get one interested in amateur radio. When I have a HF set-up I will have a list of contacts overseas I have made via IRLP and try to contact them on HF.

As a newcomer to ham radio IRLP has made me want to get my HF gear, hf antennas etc sooner, ie IRLP has encouraged me to make international contacts on HF one day

As for the IRLP contest I think it's great, because I've never been in any AR contest, although after listening for a while I did give out some numbers for the John Moyle Field Day. To me the IRLP contest is a great way to have fun and at the same time learn about contesting, as a newbie to AR I've never being in a contest before, nor did I know what they were all about. Yes, I do read, but if your new to ham radio, all that information on the various AR contests in AR magazine didn't make any sense until I started participating in the IRLP contest, now I've got some idea of how a contest works, instead of having to learn in the middle of a pile-up. (Like the one at the beginning and end of each three hour block of the JMFD, here in Melbourne the 2m/70cm FM call channels where very alive, to say the least) Note also that I intend to try many different aspects of ar besides FM repeaters, FM simplex and IRLP.

As a newcomer to ham radio the IRLP contest meant that I participated (gave out about 15pts as Home Station) in the John Moyle Field Day, which I wouldn't have done without the previous two days practice at contesting on the IRLP mode, as I didn't have a clue about contesting.

So, IRLP is bad because it's introduced a new ham to contesting and international contacts. I'm so disappointed that IRLP taught me these skills. Not.

Now, I'm looking forward to the next Australian contest that includes V/UHF

FM and I'll participate, as I will in HF contests when I have HF gear. The IRLP Contest has provided the opportunity for me to be introduced to, and learn about contesting in a contest that is relaxed-pace one, so unlike a 'pile-up' on HF with a newcomer trying in vain to get through, I've got some practice at calling "CQ Contest" and responding.

And the last one for a 'newbie'. No I don't know CW. Will I learn CW? Yes. After a while, once I have been a ham for a while I will start to practice CW. I do have a key and I do listen to CW practice transmissions from time to time.

The contest goes for a month so there would be no 'pile ups', so the end would co-incide with the IRLP Conference in Las Vegas, and the operation of Node 6392 by VK3JED in Las Vegas! Further, the Node Owners of all the Participating Stations have given the Bass IRLP Group permission to use thier nodes for the contest. If the knockers took a look at the Participating Nodes list they would see that the UK and USA have many more nodes listed than other countries.

Should I try packet and satellite work? How about ATV? I'd ask, but too many people in here will say "that's not ham radio" so I'll try them all anyway and see what takes my fancy :)

PS:Any VK3's with a packet TNC to sell or know where to get one from?

VK3HAG@NERG.NOSPAM.ASN.NET.

Oh I don't think so Brian. Spark was a MODE not a different system of
sending the information.

CW is continous wave. I.E. still sending information by the same method.
I.E. over the airwaves now called RADIO.

Do you see the difference yet?

I do. And so does anyone else with a brain.

Look...new technology is fine. Old technology is also fine. But these two things ARE NOT INTERCHANGABLE. Radio is Radio. Internet is Internet. Get it?

Dan/W4NTI

I believe Dan and myself are *not* insisting that people do things *our* way. IIRC, Dan is mainly CW and at least some SSB.

I do probably 90 percent PSK31, a VHF net check-in, and some SSB contesting.

Have he or I been insisting on people using our favorite modes?

I know that my objection to the internet modes is *not* their existence, but that so many of their adherents want to call them "radio". And having a contest only exacerbates the silliness.

And yes, a person uses their radio to access the network injection point. Not much of a challenge, that.

QSL cards can be exchanged for any sort of radio contact. There are no rules. Perfectly ok to QSL after an eQSO/Echolnk/IRLP contact. The problem will arise for DXCC when the card does not make it clear that the QSO was not 100% radio, and these cards are used to claim awards.

THE CONTEST IS FOR IRLP MODE ONLY

RULES:

The contest will be held starting MARCH 18 at 0001 GMT and ending APRIL 17 2359 GMT

POINTS WILL BE AWARDED AS FOLLOWS-

1. 1 point for a contact with someone not in the contest in your own country
2. 2 points for a contact with someone in the contest in your own country
3. 2 points for a contact with someone in another country who is not in the contest
4. 3 points for contact with someone in the contest in another country
5. 5 points for contact with single node countries and special event stations such as the International Space Station etc

6. The following information must be included in your log
NAME
QTH
NODE #
CONTACT NUMBER-I.E.- You are number 001

Any contacts without this information will be counted as a single point contact.

7. At present the logging program that will be used will be DXKEEPER, which is available free, on line.
8. For those without computers, paper logs will be sent to BRUCE DEHN
306 CRIPPLE CREEK CT.
V.A. BEACH, V.A. USA
Logs should be sent in within 30 days of the end of the contest.

9. No duplicates allowed. one contact per callsign.
10. All nodes and reflectors may be used as long as the node/reflectors allow. persons who abuse this privilege will be disallowed from the prizes.
11. Only voice communications allowed. (Maybe next year we will allow other modes)
12. Electronic logs are to be emailed to apostle465@netscape.net for disposition.
(keep a copy of your logs for your own records)
13 Please include as much information as possible in your logs if you want an accurate count. again, please note with each entry, what you think the point count should be for that contact.
14. All amateur radio rules and regulations apply especially any involved with nodes/reflectors.

TRY AND KEEP TO THE RULES AND DON'T ABUSE THE NODES/REFLECTORS.
HAVE FUN AND HELP PROMOTE IRLP 'KEEPING THE RADIO IN AMATEUR RADIO' AS A VIABLE METHOD OF COMMUNICATIONS

Only the nominated Participating Nodes may be used for the contest. However, nodes that are connected to Reflectors that are Participating (ie a UK Nov node) still count, but only the Participating Nodes may be connected to by contesters, therefore it is fair to all stations, as only those nominated in each country are participating nodes. Note that new nodes are added daily to the participating list.

Are you seriously labelling the morons who indulge in this sort
of nonsense "operators"? Seriously?

73 de Jock.

I don't think anyone is saying "shut up" etc. I'm saying unless ILRP impacts you, why worry?

Over the years I've come across many amateurs who hated some aspect of the hobby- packet, anything computer based,........ Not one ever seems to have found a niche they really do like.

Hmm, and what someone else calls it bothers you? AND they want a contest.

The cheek of it!

This a akin to "How many angels can dance on the head of a pin." Take a chill pill.

> And yes, a person uses their radio to access the network injection
> point. Not much of a challenge, that.

So don't do it yourself, seek out something you find rewarding rather than worry how others get their kicks.

Oh I agree that it isn't much challenge but so what? Who are 'they' harming?

What I don't 'get' is why people get so 'up tight' over such things?

If people enjoy VOIP systems fine, if they don't, fine. Ditto Morse, Packet,
Phone, Repeaters, ...

I've yet to see a facet of the hobby that has adversely impacted my
enjoyment- even if is a facet that leaves me cold.

What is this urge to insist everyone does it 'your way'?

Dan, why are IRLP fans so quick to tell people to shut up and go away when someone disagrees with them. Are people like you and "concerned amateur" typical of what we might meet if we sample the mode?

Which opens up another area of consternation. Here it is; If you don't do
it via radio, you don't qualify for a ham RADIO award.

Dan/W4NTI

Certainly. One of the major reasons that I got into Ham radio *was* the
phone patch. One of my other hobbies is off road 4WD'ing. North of my
QTH is a great place for that. Unfortunately, I sometimes get stuck, and
extricating myself can take anywhere from a few minutes to half a day
(and I think you IRLP'ers have some odd ideas on how to have fun!!)
hehehe but I digress. My XYL gets a bit worried when I don't show up for
dinner, and cell phones just don't work that far out in the woods. But I
can patch in with either my handheld or truck radio, and let her know
I'll be late. All this much to the amusement of my local Ham bud's.

Well, I don't know what your situation is for the lower HF bands. But remember, my issue isn't with the mode, even though I don't care for it. I just think things like contests are silly.

>
>>>Yes, DX contacts via HF are nice, and may be what many consider to be

Well, I can see a difference when most of the transmission is via fiber rather than the air.

Or, will it encoiurage newcomers to simply stay at the lowes level, because if chatting to people around the world is their goal, then they have achieved it. As I have said, if that is what floats their boat, then so be it.

>>>I do, however, agree that a 24/7 contest for a whole 28 days is starting

> I agree EchoLink is just not amateur radio, although I use it sometimes from
> inside the house where the XYL wont let me bring my radios!

hehe, my XYL was also pretty critical. I did eventually tell her that
I was thinking about taking up a new hobby in place of amateur radio.
The new hobby was going to bars and chatting with loose "wimmin". I
retrospect, the ham radio didn't seem so bad. Now as long as my antennas
aren't too obvious, she doesn't complain too much.

But again,
> rather than criticise and make fun of their chosen mode, wouldn't we be much
> better off encouraging the use of other modes????

Oh, heck, when you put it *that* way........ 8^)

Well, in that case why don't you call it something else. Then come back
when someone makes you call it by the name that upsets you.

Untill then, 'mellow out'.

In the scheme of things to worry about this must rate below which shoes I
wear tomorrow.

Right. II understan you, but at least two peopple here have told me to shut up. Or go away, or something like that.

Considering that this is a Usenet group, wouldn't shutting up and going away deprive them of a good row?

Bollocks. That rules out repeater linking and remote shacks using any form
of landline. I hope you can convince the DXCC committee to reject all those
QSL cards from peole using remote bases.

Brad

The argument I see here is some appear to be *AGAINST* IRLP therefore it
should not be allowed on the Amateur Bands, and that is what is annoying
me the most.

My attitude is that any Amateur should be free to operate what ever
band, mode, etc. they wish provided they are not interfering with others
without being hounded by others simply because they don't believe that
mode (or what ever you want to call it) should not be on Amateur Radio.

There is plenty of spectrum for us to *SHARE*, to pursue the hobby in
the way each of us want to. Although I have not operated CW myself I
hope that allocations remain for those that do make use of this part of
our hobby. Just because I don't operate a given mode does not mean that
I should believe it be abolished.

The great thing with our hobby as I see it is that there are so many
different aspects of it to explore, IRLP is just one of them!

Well, perhaps.. Then again *I* think that CW contests are silly!!!! ;-)
(now watch as I am slowly flamed by all the CW operators!!)

No, seriously, I agree that perhaps "contest" was a poor choice of titles for it, although I see what they are trying to do - just the same as we are all trying to do and get people active in some way. I also think the 28 days was a tad too long, for *any* 'contest'. Maybe if it only included simplex nodes, or at least a special category to encourage these, that would've been better as then at least there is some additional skill needed to erect an antenna suitable for simplex contacts (a piece of string often suffices for repeaters!!).

[SNIP]

Yes, so can I, but amateur 'radio' encompases many, many different technologies. The days of "wireless" are long gone, decades ago the thought of connecting a computer to give Packet or SSTV would no doubt have also been frowned upon as 'not amateur radio'.....

>

>

I think that depends a lot on several factors, including the attitude of fellow amateurs and how much encouragement we give them to try other bands. Of course, if money or space limits your abilities then perhaps IRLP will be the only option used, but I would much prefer in that case a licensed amateur use IRLP rather than see them just give up their licence and leave the hobby!

For those that can set up other bands, it is up to fellow amateurs (I believe) to 'spark their interest' and encorage them. I have seen young Scouts and Guides amazed at how they can chat via radio to people all over the world, but often the lead up to them experiencing that is to get them on Packet and show them how a computer can be linked to another computer without using phone lines.. By sparking their interest using something they know (computers), we get them to try radio...

[SNIP]

Too true!! It would certainly be nice to see them progress and take part in other 'on air' contests next year!

I have no problems with antenna's from the XYL, just none of those damn noisy radio's inside! Has something to do with not enough room I guess.....

>   But again,
>> rather than criticise and make fun of their chosen mode, wouldn't we be
>> much better off encouraging the use of other modes????
>
> Oh, heck, when you put it *that* way........ 8^)

I fully understand your feelings about IRLP, but I just don't think that publicly criticising those that choose to use the mode is of any benefit, to anyone! If you (or anyone) truly felt strongly enough about the length of the contest, then I'm sure that politely worded notes to the organisers would've gotten much further than some of the whinges we have seen on here! Otherwise, for those that simply don't like IRLP, for whatever reason, is there really any benefit to telling everyone this? I don't like CW, but I don't make a big fuss everytime a CW contest is announces - I simply don't take part in it! Likewise for those that don't like Packet, or RTTY, or SSTV - I guess they just avoid those modes. So why should we start a debate about IRLP that just ends up making us all look rather childish?????

Anyway, have fun and don't get too bogged in that 4WD!!!!

>>
> As I said....call it whatever they want.  But it ain't Ham Radio.

oh!! yes it is

let's take it one bit at a time

R = repeater = radio, receiver of repeater linked to
        transmitter of a repeater in another country
        the reverse is true.

I = internet, no problems here

L is for linking, no problems here

P is for protocol, to enable the two repeaters
        to be able to be linked to gether, it is
        radio at both ends.

what problem do you have with this

As I Australian living in the UK, I personally can't understand the "Dial-A-Contest" principle, so Ashley it's not just "whinging poms" that can't understand the need to have this pointless contests on the Internet.

>"It isn't the good old days of the colonies when people actually gave a
>rats what pommies had to say"

Didn't Australia just vote to keep the monarchy? I believe we did and voted to continue to be ruled by the UK.

I personally voted against, but the majority voted to continue being ruled by the UK, so in a way Ashley our Country agreed to "give a rats" what the UK poms say"

Sorry just had to throw that in the lighten the mood :)

Well, you certainly seem upset.

>Its just my opinion.

Fair enough, and live by it by simply having nothing to do with VOIP etc.
Leave those who like it to do their own thing.

I didn't vote for the system to be altered because they didn't offer a directly elected option, and if the claytons republic option had gotten through then no second chance would have been available.

This way the republic is still on the agenda and there is likely to be another referendum in the medium term (say the next 20 years), with a good chance it'll include a directly elected president (or Judge Advocate General) or whatever you want to call the re-named directly elected replacement for the govenor general.

Hello!

I'm Motorola P080 tranceiver owner. The one I use went probably broken - it gives a short beep afrer powerin on and displays "EPM ERR" message.

Possible cause of this malfunction is application (Tuner32 for Motorola
programming) failure during the programming procedure.
Some parameters of my TRX were changed, but this application doen't allow me
to restore their last values. My attempts to restore some older
configuration files don't give any results.
I also tried to use EntryLevelProgramming application - it also gives no
positive results. I'd appreciate any suggestions, how to repair it.

Best regards, Jacek.

I gather none you are licences amateur radio operators, 2 meters is in
reference to the 2 meter band, aka 144 to 148 Mega Hertz. And the mode of
operation is FM aka Frequency Modulation. It's not a "cb" childrens band
lingo, it's actually "Amateur Radio or Professional Radio" lingo.

I am a licensed ham operator who uses the 2 meter band frequently. I
have picked up usage from other hams. This is the most common band
used for public service events.

Have not touched CB/11 meter very much, and none recently. Too much
noise from those operating illegally overpowered units. Probably still
have one in the basement. These days, I would not think it reliable
enough to use for any emergency use, and FRS to be superior for the
car-to-car usage within a caravan.

James is merely trying to stir up trouble, and does not care to help
new hams. Many others like that who are anti-Elmers.

Yes, 73 is enough, no need for 73s,

Happy trails,

Really? To me it just makes the intending participants look even
sillier than before.

73 de Jock.

Dear Dear Brian.

you mean...you dont know ???

Surley you could have come up with a more definite statement than THAT ??

:
: Technology moves on, that is the nature of things. No one is forcing you to
: use ILRP or any of the other modes.
but yet you force M3 candiates to do a MORSE ASSESSMENT ??

No UK morse assessment pass = no UK licence whatsoever (FACT!)

COMPULSORY MORSE remains in the UK...
something you had a problem with prior to ITU meeting.

have a really really nice day Brian.

There you go putting words into my mouth again Brian. I never said I hate IRLP. I said I don't like it being called Ham Radio.

And I don't much care if you like my opinion or not.

So there.

Dan/W4NTI

Gawd Almighty you Ausies are a thick headed bunch, ain't ya?

Ham RADIO is communications with a RADIO or a RADIO system.

INTERNET is communications with a NETWORK of interconnected computers
organized in such a manner to send "packets" of data world-wide.

Do you see any mention of RADIO there?

Next.

Dan/W4NTI

Because I am right, and you are wrong. Further more I am NOT trying to
force you to believe it my way. I am just trying to show you that you are W
R O N G.

Keep calling IRLP or VOIP Ham radio all you want. The rest of us know
better.

What I don't like is the way you are putting down a legitimate part of
the hobby. Whether you like it or not it IS a legitimate part of
Amateur Radio.

I've got bad news for you, with a quick check of
http://status.irlp.net/statuspage.html showing a total 1595 IRLP Nodes
within the IRLP network and 139 currently engaged in use as I post this
message, that IRLP is a popular and *VALID* part of Amateur Radio.

Just because you do not see it as part of Amateur Radio that it isn't.

It might not be part of YOUR hobby, but that is a different story.

You could spend some time on rabbit hunting but since you are new to radio as a whole, you likely don't want to do that. In a nutshell, the guy is line of sight, and can be found. Is he being heard through a repeater or simplex? Get several guys, scattered around your community, to listen for his signal and get some idea where it is the strongest and work from there. Cheap 2 meter direction finders can be built from kits and this might be a good project to learn how to solder if nothing else. If you can get very close and he knows it that might be all it takes to silence the guy. I'd never suggest doing anything illegal to him once he is located.

So what are X25 "packets" then?

> Do you see any mention of RADIO there?

Well If I use IRLP (and I don't contest btw) then I talk into my "radio" and
someone else talks into thier "radio"

The middle bit is "packets" like my old VFH "packet" radio

Yes, as a matter of fact, because the correct name for IRLP is Internet Radio Linking Project. See www.irlp.net Note that is a USA website describing IRLP, not an Aussie site...

A quote from the irlp.net website:

"The aim of this project is to reliably and inexpensively link amateur radio systems without the use of RF links, leased lines, or satellites."

So, next question?

> It seems to me the ONLY person here having a problem is Brian.

The problem I have is understanding the bitterness I see over something
that, for most people, would rank below picking tomorrow's breakfast
cereal. . If someone wants to call VOIP 'amateur radio' so what?

All I can assume is that you sole status in life is rooted in your
'position' as a radio amateur and you see the use of the term amateur radio
applied to VOIP some how devalues that status.   If that is so, you have
more important things to worry about.

Whether it is radio or not, if you are not a fan of contests, (and I am
not), then those contesting via IRLP may well result in a decrease in HF

radio traffic, leaving the DX clear for others. Which I appreciate...

So, long live IRLP !!!!!

Cheers and 73,

Stan, G4EGH.

Unless I'm really misjudging this guy, I might not even need to get very close. All I would have to do is let him "overhear" me talking about DFing him, and how much I want him to talk, because every time he makes another inane comment I get that much closer.
I think what interests him is the reaction he gets from some people that makes him think he's capable of doing something that others dont want him to do but are powerless to stop. If he could be made to think that people wanted him to talk (so they could DF his signal) he'd probably clam up in an instant.

The quote you give almost sounds like he is someone who has had a ham
license, one of the ones who feels that the testing has been watered
down. You can look up radio licensees by the town, and you might focus
your search this way to start with.

Also, in the US, the ARRL has a program for "Official Observers" who
basically give official reports to the FCC about those violating the
rules on-air, extending the "ears" of the FCC enforcement operation.
Their reports are given more credence than those coming in from some
random person.

You might check if RAC and Industry Canada have a similar thing.

Being upset that hams talk about radio equipment on the air? Seems a
bit foolish.

Happy trails,
Gary (net.yogi.bear)

Because it demeans the hobby and brings it down to a level akin to that
of CB. That doesn't bother you?

Firstly I don't agree that VOIP systems brings a "CB element" to the hobby,
any more than any other facet does.

Secondly, if I look across all the bad elements I've come across in the
hobby, only a few entered it via the CB route.

You must really think you are better than everyone else around you, you
really are a SNOB!

Get over it, whether you like it or not Amateur Radio is evolving, it is
changing. You can still play with your spark gap transmitter if you
want, nobody is going to stop you. So you are wasting your time trying
to stop others to enjoy the hobby of *AMATEUR RADIO* in the way they see
fit within the *GUIDELINES*.

1. It doesn't demean the hobby, it widens it's appeal to a more inclusive group.
2. CB isn't better or worse than amateur radio, it's just less technically orientated.

So... no... not only does it not bother me, I approve of people calling VOIP amateur radio.

I'm looking at a Kenwood TH-F6A and an Icom IC-T90A. I think the Kenwood is
a bit better but of course $50 more.

Is there a better choice I might be overlooking?

P.S. I'd really like to find an airband TX as I'm a pilot too...

John,

Can't comment on the T90, but I have the TH-F6A and
have no complaints.... dunno about the ICOM, but
Kenwood has free pc-control software for the unit.
If you plan to use a PC to program the it, you might
make up the $50 in software. Also look at the
cost of their control cables.

regards
rob

The T90 will Tx 118-136 if you take it out of band, and NBFM ONLY.
The OOB Tx is, for the most part, very low power {usually <1W} & will
eventually toast the {hard to replace} finals at the same time.
It has Rx intermod like most tiny HTs {lots}.
You do have to pay extra $ for the crappy programming software &
cable.
Got one..it's OK. Definately not the "end all" of radios, but I use it
primarily for Rx {it fits nicely in my large greasy ear} ;-).
Don't know beans about the Kenwood.

Here's a WEIRD idea. What if you used NFS to mount one servers /dev
directory on another's server, ie /mnt/remote/dev

Then what would happen if you did a:

```
dd if=/mnt/remote/dev/"soundcardinputdevicename"
of=/dev/"soundcardspeakerdevice" bs=xxxxx (play with the block size)
```

Just a thought! I've never tried it.

Ah yes, one typo, on an unfamiliar lap-top keyboard, quickly corrected in a follow up post, as opposed to a decade of pseudo-dyslexic repetitive drivel. I think you've beaten me there....<sigh!>. Incidentally, I don't use a spell-checker, perhaps you need to try it.

You are missing a detail. You can't access the systems with a PC. That's
what Dan, Walt and all the others who are ignorant of the facts are confused
about. Perhaps the title "contest" is a misnomer, "QSO Party" might have

been more appropriate.

But anything which gets hams out of the sofa and back on air can't be a bad thing.

Brad.

: Ah yes, one typo, on an unfamiliar lap-top keyboard, quickly corrected in a
: follow up post, as opposed to a decade of pseudo-dyslexic repetitive
: drivel. I think you've beaten me there....<sigh!>. Incidentally, I don't use
: a spell-checker, perhaps you need to try it.

Dear Dear Dear "Walter" or whatever your real name is ...

Since we are on the subject of SPELLCHECKERS which seems to be the
only item that you and several others can have a go at me over...

And given that those who previously had a go also fell on their faces
by mis-spelling something themselves....

I decided that it was time to go back in to the archives of google
to see for myself just how good you really are...

And of course...
right away...
your ability to make mistakes came up without too much filtering.

So you see "Walter" dear chap....
even those who think their spelling is brilliant can make mistakes...

As a second time winnner of the 12wpm morse TEST, I know i'm not perfect.
And on this newsgroup as elesewhere, I never claimed that I was.
But you won't see me running away from a morse test or encouraging others
to run away either and you certainly will not see me congratulating people
for running away.

Please note that these postings are from MAY 2004 ONLY !!
I shudder to think what other glaring spelling mistakes I might find
and to save you the embarressment, I decided to only point out a few.

here we go...   (Ref: COLLINS ENGLISH DICTIONARY)

Absolute rubbish and squirming of the highest order! You do it merely as a
feeble attempt at insult,and a sexually descriminatory
one at that. The very fact that you seek to justify it only enhances the
validity of your intent.

[snip]

Walter R.

SPELLING MISTAKE: SIMILIAR SPELT WRONG
SPELLING MISTAKE: MISCHEVIOUS SPELT WRONG

= = = = = = = = = = = = = = = = =

I doubt that you will be able to claim that every one of these mistakes was as a result of an unfamiliar keyboard but I expect you might!

If you have been on this newsgroup for as long as you claim you would remember others falling foul of their own mistakes too and by criticising my spelling but you obvously dont remember which leads me to doubt your length of presence here.

The list of exposed failed-spellcheckers
gathers another member to its tail.

So, as you see "Walter" or whatever your name is (hiding in the shadows), slagging off someone for their spelling errors isn't very nice.

Do have a really really really nice day.
=======================================

Your ever friendly and supportive ZZPK

Quoted from the CQ WPX Rules - "Maximum power allowed is 1500 watts
total output"

Must be REALLY HARD keeping that PA cool!

Micky

```

I live about 8 miles from 4 local tv stations, and 25 miles from a much desired UHF station. Luckily, they are all in the same general direction.

I plan to buy a medium size vhf/uhf antenna. My coax run will be 50 feet.

Although I don't really need "gain" for the vhf stations, I do need it for the uhf station. "Some" extra gain will be ok for the vhf stations. Whatever the setup, I want to use the lowest-loss RG6 that I can buy.

Here are my questions:

1. Where (online or else) can I find the very best, lowest loss RG6 coax ?

2. Assuming that I need a pre-amp, if I only have a 50 ft run of low-loss coax, will my system work well if I mount the preamp at the tv end of the 50 ft coax, as compared to putting it at the antenna? I realize the advantage of mounting at the antenna, yet I would like the convenience of having the pre-amp inside. I am considering an adjustable pre-amp, and that would be more usuable if I had it at the tv instead of at the antenna.

3. Will a brick chimney (with no steel liner or inserts) about 20 feet from the antenna, but in-line with the desired stations,   attenuate the signals ??

4. Are the Radio Shack pre-amps decent ??

My thoughts: Perhaps I will get a pre-amp that will produce about 20 db of gain.   I will mount it inside. The 50 ft of coax will have a loss of perhaps 5 db, so I have a net of 15 db gain at the tv.   This will be more than enough for the vhf stations that are pretty close, but I am not sure about the uhf station 25 miles away.   It would seem to be good enough for that as well.

What do you think ??   Thanks for any advice !!

--james--

1_ there is very little differance in the loss of the coax if name brands
are used. Get some that has a braid and foil shield. Forget about all the
stuff that is quad shielded and other things unless you get it at a good
price. Look for Belden if you can find it .

2- with the station only 25 miles away and only 50 feet of coax you should
not need a preamp. With the VHF stations that close you might even get too
much signal and the stations will overlaod the preamp and the reception
goes all to pot. (simple explination)

3- probably not so much that you could tell it.

4= almost nothing from Radio Shack is worth it.

You want quad shielded. They're all pretty much the same. Any electric

supply house would have it. You didn't say where you are. A thousand foot
spool costs $110 at http://www.smarthome.com/8527.html

No real need for a pre-amp if you are 8 to 25 miles away. I would just get
the next size up antenna (or one with just a better UHF element) if you are
worried about a weak signal.

Umm. Not really. While you will find people with sufficient technical
experience, the vast majority of readers are licenced amateur radio
operators and would definately look down on any sort of pirate
activity.

That said, I have met people (usually taxi drivers) who are interested in building or putting up a radio station back in their home country of Somalia where there is no government, no rules and pirate radio is actually a very important and useful part of their society. In Somalia, according to one individual I spoke to, one time a group of militants were coming into town with plans of genocide. The local "private" radio station was a valuable tool to warn people about the pending attack and it probably saved lives.

Rob

Use RG-6/U.   It definitely has lower loss than the cheap stuff with the foil shield.   And don't use the twist-on connectors. Get good connectors and a crucher to install them.   Most problems are caused by poorly installed connectors.

Amplifiers introduce noise and decrease signal-to-noise ration.   Don't use an amplifier if you don't need it.   If you do need one, avoid the Radio Shack models. I tried one and it caused lots of problems.

Well, yes, of course.  I just thought a discussion of the merits of
low-noise amplifiers might be beyond the scope of comprehension for the
OP.

Right advice, wrong reason.   If the noise and signal are both
amplified, the signal-to-noise ratio will be unchanged.  The problem is
amplifiers add noise, lowering the SNR.

> 50 feet.

Use two separate antennas, one for the local stations and one (yagi or corner reflector with gain) cut for the 25 mile distant station. Join them together with a coupler at the antenna. No preamp should be needed.

> 1. Where (online or else) can I find the very best, lowest loss RG6
> coax ?

Any name brand double-shielded coax (Belden) will be fine.

> 2. Assuming that I need a pre-amp, if I only have a 50 ft run of
> low-loss coax, will my system work well if I mount the preamp at the
> tv end of the 50 ft coax, as compared to putting it at the antenna?

Don't use a preamp unless you install it at the antenna. Preamps amplify noise as well as signal. One exception is where you are using a preamp for distribuiton purposes -- assuming that you have a good signal at the house end of the coax you can add a preamp to boost the signal prior to distribution via a multi-set splitter. But if you have a good antenna you won't need a preamp for a single set installation.

> 3. Will a brick chimney (with no steel liner or inserts) about 20
> feet from the antenna, but in-line with the desired stations,
> attenuate the signals ?

It should not be a problem for stations 8 miles away, but for the 25 mile distant UHF station it could be. If you use the two antenna configuration will the UHF antenna be pointed far enough away from the chimney to miss it? If not, consider mounting the entire antenna assembly on the chimney with a chimney mount.

> 4. Are the Radio Shack pre-amps decent ??

I'm not a fan of RS products, but their distribution amplifiers work OK.

hello, i'm relatively new to ham radio and had a few technical questions i was hoping to throw out...anyone that can answer these would be very helpful!

1. i've seen transmitter schematics that were simple, and others that were complex. as a general rule of thumb, are the more complex ones trying to compensate for frequency drift, or maybe eliminate higher harmonics? how efficient and/or stable are the simple transmitter schematics?

2. other than frequency range, what characteristics are you concerned about when trying to match a transmitter to an amp?

3. without an amp, couldn't you still run the signal to an antenna and it would be a weak transmitter? all the amp does is increase the voltage and current supplied to the antenna, correct?

4. for an FM transmitter, does the modulation occur to oscillator directly, or is the oscillator's signal modulated after "leaving" the oscillator? i guess what i'm asking is whether or not there is an input to the oscillator, or is it just an "output only" frequency generator?

thanks!
jason

Hi Jason

Nice questions, let me try to answer a few ..

<razorbladeshoes@gmail.com> wrote in message
news:1110486073.267964.53290@l41g2000cwc.googlegroups.com...

> 1. i've seen transmitter schematics that were simple, and others that
> were complex. as a general rule of thumb, are the more complex ones
> trying to compensate for frequency drift, or maybe eliminate higher
> harmonics? how efficient and/or stable are the simple transmitter
> schematics?

One obvious thing is that CW transmitters tend to be simple, SSB transmitters complex. But there are a thousand design variables. One big one is the complexity of the ICs employed. Today you can have a very stable VFO with just a few parts. You tend to pay a little bit of a price in phase noise, but frequency drift is not an issue. With an analog VFO, you can add a lot of complexity trying to get around frequency drift, but phase noise is never an issue. Years ago, all you had was analog. A few years ago, DDS (direct digital synthesis) was complex and expensive. Today, analog VFOs tend on the expensive side! It is similar with amplifiers. In many radios, all, or most, of the PA is in a single brick, instead of a fistfull of parts. Ditto with almost everything up and down the chain.

Frequency is also an issue and again that is changing with technology. A few years ago, it was hard to get directly to VHF. You typically had several oscillators getting mixed up, frequency multiplied, etc. This was especially true if you had an analog VFO because it is very hard to get stability at VHF, and multiplying the frequency also multiplies the drift in an analog VFO. There are still reasons you might want to do some mixing up to get to VHF with a DDS VFO, but DDS parts up into the gigahertz range are now cheap parts.

It was only a few years ago that a DDS VFO cost hundreds of dollars. Today you can buy a chip with a VHF synthesizer and amplifier and modulator for less than the tuning capacitor in an analog VFO.

> 2. other than frequency range, what characteristics are you concerned
> about when trying to match a transmitter to an amp?

If you are buying commercial, you are looking at price, of course, and expected reliability, along with power consumption. For SSB, you need the amplifier to be linear, which implies lower efficiency. For FM/CW you don't need linear, so the amp can be a lot more efficient. If you are designing the amp, then you are worrying about impedance mathcing, as well.

> 3. without an amp, couldn't you still run the signal to an antenna and
> it would be a weak transmitter? all the amp does is increase the
> voltage and current supplied to the antenna, correct?

Yes of course. There are times when you want a lot of power, but most of the time it really isn't necessary. Also, it is a lot easier to get antenna gain than power to the antenna, especially at higher frequencies. The need for power depends a lot on what you do, what frequencies you operate, and to a degree, what "floats your boat". If you are doing EME or HSMS, you need a fair bit of power - hundreds of watts, anyway. If you are chatting on the local repeater, typically a watt is as good as a kilowatt. Lots of folks called QRPers like to use very low power. For them the "legal limit" is five watts, but many try to see what they can do with milliwatts. The current miles/watt record is held by a guy who operated 40 microwatts over a 500+ mile path.

> 4. for an FM transmitter, does the modulation occur to oscillator
> directly, or is the oscillator's signal modulated after "leaving" the
> oscillator? i guess what i'm asking is whether or not there is an input
> to the oscillator, or is it just an "output only" frequency generator?

Typically you would modulate the oscillator, although these days, the audio may well be simply data to the synthesizer. However, because FM is typically done at VHF and higher, there may well be additional oscillators mixed with the modulated signal to get up into the VHF/UHF range.

Hope this helps

Good info to know. I was kinda looking around to make a (mostly) IC
transmitter like that... (anything 70cm and under). Are you aware of
any chip PN's or schematics I could dive into to learn?

Thanks,
Dave

Analog Devices' parts are favored by hams. The greatest number of projects out there use the AD9850, but that part is a little older, and does not provide modulation input. Also, it is really only good up to about 30 MHz, you can push a bit past that but the power requirements explode and the noise goes up. Without any component changes it will go down to 1 Hz. Newer AD98xx parts are starting to get more attention, and some of those are useful up into the low 100's of MHz. The 99xx parts have more features yet.

TI has a TRF4400 which is a 440 MHz synthesizer with modulation and an amp (not much of an amp, tho!), and the almost identical 4900 for 900 MHz. Some folks have used these down to 6 meters. The TI parts have greater channel spacing than the AD parts, but that also reduces the frequency of the crystal or oscillator, which has a big effect on the power consumption. TI also has a 2050/1/2 which are synthesizers (I don't recall if they have modulation) up into the gigahertz range. I've been toying with using one of the TI parts as a VFO for an HF rig by using a prescaler to divide down the frequency (and consequsntly the spacing).

The AD parts are pricey, but AD is very good about samples. The TI parts are all in the five buck neighborhood. There are a zillion projects/kits out there based on the AD parts.

If you've ever built an analog VFO, these DDS parts are like black magic. They take little in the way of support circuitry, no fretting about layout, no spending weeks trying to work out the temperature compensation, no moving around because you breathed on it, you just dial in the frequency you want and you are spot on.

use a remote line powered preamp near the antenna. Put it in the attic if you want to be able to serivce it.   You can use RG6 or even low loss RG59 is you use a preamp near the antenna.

since yo uneed it for UHF only, try to find one that has only a little gain at VHF.

The key to a good signal to noise is to have a minimum loss BEFORE the fist amplifier. Putting the amplifier after the coax is NOT as good as putting the amplifer before the coax.

But a few feet won't hurt so mounting it in the attic where you can get
to it easilly is a good compromise.

Mark

As a video pro, I recommend the higher quality RG-6/U with braided shield.

Low quality RG-6 with a foil shield will both radiate and absorb signals on similar channels (say... same channel cable and off-air signals).   If cable tv is not an issue, maybe the cheaper stuff will work, but you can still have problems if, for example, there is a channel 3 or 4 in your area and you use a VCR that re-radiates at that channel.

I got tired of the ghosts, threw away all of the cheap RG6 with the pre-molded connecters and put my own connectors on the best RG-6/U that I could buy.

No more ghosts... and the best signals I've ever seen... These were the results.

designing
> the amp, then you are worrying about impedance mathcing, as well.

i guess what i meant was more along these lines: you need to make sure
the peak-to-peak input voltage and current capabilities of the input is
matched with the amp, right? or does the amp have a lot of leeway in
those regards?

> > 4. for an FM transmitter, does the modulation occur to oscillator

just to make sure i have it straight, if i were to transmit a sine wave
at 146mhz, anyone listening in on 146 mhz wouldn't hear anything
(except maybe less noise than usual). if i were to vary the frequency
between 146.0001 and 145.9999 at a rate of 100hz, then anyone recieving

would hear a quiet 100hz tone. now if i were to vary the frequency
between 146.001 and 145.999 (holding all previous listeners constant),
then anyone listening would hear a much louder tone...correct? or am i
not understanding it yet? ;-)

thanks again for the help!
jason

Actually, no. Typically the amp doesn't have a lot of flexibility there,
but in general the exciter does.

In amateur practice, the impedance of almost anything that connects together
at RF is 50 ohms or converted to 50 ohms. Given that, the power level then

converts directly to voltage and current.

Typically, HF exciters have a lot of range in output power. The FCC prohibits the sale of HF power amplifiers having a required drive of less than 80 watts. Since most HF exciters have 100 watts out, the required input power of HF amps is rarely specified, since it will almost always match almost all exciters. I don't think other countries have the same rules, but the FCC also requires that the amps cannot easily be modified to accept lower drive, so it is expensive for manufacturers to make amps differently for different markets, since that typically would require a complete redesign.

On VHF, it's a little different. Most VHF exciters only have a few output power settings. VHF amps generally specify the input power, and typically, it will be a fairly wide range. But still, if you want, say, 200 watts at 2 meters, you would buy a different amp for a 5 watt HT than you would for a 50 watt mobile.

> not understanding it yet? ;-)

That is exactly right.

There is a weird behavior of FM receivers called the "capture effect". A signal of sufficient amplitude at the input of an FM receiver cose to where the receiver is tuned will totally quiet the receiver. In an AM, CW or SSB signal, the amplitude is converted to audio almost directly. As a result, noise on the input appears as noise on the output.

FM is different, though. In FM, we want to hear the frequency modulation. When there is no signal, we hear the detector randomly wandering around trying to interpret the noise as signal, but the amplitude of the noise really has no effect. Once a signal is detected that is strong enough for the detector to follow, the detector follows the signal and there is no more noise. To exaggerate this effect, most FM receivers amplify the signal so much that the amplifiers become saturated and amplitude variation in the input signal is clipped (well, softly clipped), so that the later stages of the receiver see the same amplitude. This is different than AM/SSB/CW where it is the amplitude changes you are looking for.

This is one of the reasons that FM signals have so much higher quality ... any noise is actually a result of noise in the receiver (or transmitter) rather than the atmosphere. With other modes, not only can you hear the atmospheric noise, but at lower frequencies, the atmospheric noise is many times higher than the noise inherent in the receiver.

The other reason is bandwidth. In amateur practice, FM signals are 5 kHz wide, compared to about 2.5 for SSB. In commercial practice, FM signals are wider still.

There is another "gotcha" in your description above. If you vary the carrier at, say, 1000 Hz, from say, 146.999 to 147.001, the actual bandwidth will be somewhat wider than you expect, and it will be dependent on the frequency of the modulation. I know this doesn't make sense, it has to do with some weird math. If you studied Fourier series back in school it was some abstract mathematical thing that had nothing to do with the real world. Well, guess what. Fourier has everything to do with radio! The result is that to stay within the 5 kHz bandwidth, the highest modulating frequency has to be somewhat lower than 5 kHz. This is one reason why the FCC prohibits amateurs from broadcasting music; reasonable fidelity of music requires higher bandwidth than voice.

I need to create some practice code files for guys and would love to skip some steps. What I would like to find is a program that reads a text file and then creates directly a .wav file (or something similar). I want to be able to adjust the speed of the sent character. There are dozens of code practice practice programs, but will anything do what I am looking for? I can run a program that sends code to the sound card and then in turn send it back through the microphone jack to be saved by a second program, but I'd prefer one program running, doing both jobs.

Does anyone here remember the simple CW transmitter that used a 6146 as a keyed ocillator? It would put out about 60 watts. There was a very low current light bulb in series with the crystal to limit the current that could flow in the crystal circuit. I think it was in the 1959 or 60 HANDBOOK. I used a gaseous regulator tube on the screen. It didn't chirp too badly.........Analog VFO's yes now there is a fun project!

As others have stated, you probably won't need a preamp for signal
gain. However, I use a low gain preamp as lightning protection for the
tv's input circuitry. I figure it's better to replace a $20 preamp than
to replace a $500 tv.
Bob

Many people forget their primary school science. They assume destructive transients enter as if ocean waves. Crashing and damaging only that one location. Reality: it is electricity. Electricity first flows through everything in the circuit. Only then does something (or many things) in that circuit fail. The poster 'feels' that the pre-amp will stop or block what 3 miles of sky could not? How silly.

Sacrificial protection is the classic myth. One more reason why. It would take milliseconds or longer for the pre-amp to become an open circuit. A destructive transient does damage in microseconds. Even the fastest 'sacrificial' protector - a fast blow fuse - takes tens of milliseconds to blow. Where is protection provided by a pre-amp? Mythical once we apply numbers.

A hotly debatable subject. Based upon a straightwire theory where
voltage produces heat to blow the fuse, you are entirely correct.
However when you add electronic components, everything changes. The
output of transistors in a preamp is limited by the source voltage
(Vcc), thereby limiting any surge until the transistor blows. And bear
in mind I'm talking about a surge from the tv antenna and not a surge
in the ac wiring. Without a preamp, every lightning damaged tv I have
had was damage to the tuner section, which is antenna/cable inputs and
not from ac power surges. So in my experience it is not a myth.
Bob

While it will not protect from a direct hit it may help from the spikes produced by near by flashes. I have a radio repeater on top of a mountain and the phone line connected to it is my biggset problem . I installed a couple of very low amp fuses and a couple of coils after them. The fuses blow often after a thunder storm but they do protect the other equipment. No doubt that a direct hit would take out everything.

Lightning will find a path to earth ground with or without that in-line pre-amp. It is nonsense to wish something will stop, block, absorb, or filter such transients. Anything that is going to accomplish that protection is already inside the TV tuner.

Either it suffers a direct hit or it suffers nothing. And that means everything in that path suffers the same current equally. If nearby strikes were so destructive as implied, that we routinely see cell phones and car radios damaged by nearby lightning. Too often the 'so called' nearby strike is really a direct strike. But that is beyond the scope of this discussion and is already explained (using a horse as example) in the newsgroup   microsoft.public.windowsxp.basics on 11 Mar 2005 entitled "Power surge safety".

The preamp does nothing to provide transistor safety. For transistor safety, earth ground defines that. Some inductance in the coax can assist IF the earthing system exists. But no earthing system means inline impedance (the pre-amp) provides nothing.

Richard Harrison discusses this often in the newsgroup red.radio.antenna.amateur. He posted this on 12 Dec 2003 entitled "Lightning Arrester":

> A folded VHF monopole fed by coax and well grounded at the tower top is nearly immune to lightning.
>
> Coax, inside, rejects common-mode propagation of lightning energy. Coax, outside, needs good grounding to make a good path around (bypass for) protected equipment.
>
> The equipment needs direct low-impedance grounding so that most surge energy is dropped across the coax, not the equipment. Coils of extra coax may be used to raise the impedance of the outside of the coax.

In this and most every post from experienced industry professionals, there is nothing stopping lightning damage. Either it is given a non-destructive path to earth, or it goes right on through that pre-amp and TV tuner, as necessary, to find earth ground. For those blessed with basic electrical knowledge, the transient is a current source. That means voltage will increase as necessary to overwhelm everything in that path. That also means everything in that path sees the same current. Current passes destructively down that wire EXCEPT if the human provides the transient with a better path to earth. Earthing is the protection; not some suicidal pre-amp or fuse.

If fuses blew, well now you know how much protection is already inside that tuner. The fuses quit long after the tuner had protected itself and long after the transient had completely finished. That pre-amp provides no protection.

thanks again for the help...your answers led me to a couple other questions, if i may ask?

xpyttl wrote:

> In amateur practice, the impedance of almost anything that connects together
> at RF is 50 ohms or converted to 50 ohms. Given that, the power level then
> converts directly to voltage and current.

so if i were to design a transmitter around an COTS amp, how would i determine what i needed to "drive" it at, in terms of voltage? if i have 3 variables (V, I, and R) then i'd need to know 2 of the 3, then i can solve for the third... as it is, i only know R...?

> This is one of the reasons that FM signals have so much higher quality ...
> any noise is actually a result of noise in the receiver (or transmitter)
> rather than the atmosphere. With other modes, not only can you hear the
> atmospheric noise, but at lower frequencies, the atmospheric noise is many
> times higher than the noise inherent in the receiver.

so i imagine people can do CW over FM, but does it usually occur on (I guess what would be called) a simplified AM transceiver? either a signal's present or not?

also, when people refer to ASK and FSK, is ASK basically an audio output that's been sent over FM? and FSK is more like CW, only to a receiver that can monitor both mark and space (0 and 1) frequencies?

thanks again!
jason

I believe he meant AFSK (audio frequency shift keying) vs FSK (frequency shift keying).

yes, that is what i meant. i didn't even know amplitude shift keying
existed.

am i correct about afsk being audio tones transmitted over FM, while
fsk is just alternating between two non-modulating frequencies?

That's pretty close, but not exactly on target.

AFSK can be used on top of either AM or FM. In amateur systems it's
most commonly used with FM.

FSK shifts the carrier frequency... a process which counts as a
modulation. The amount of frequency shift (in Hz) and the rate at
which you shift it (also in Hz) vary a lot from one usage to another.
There are both narrow-band and wide-band FSK modulations in use.

thanks! also, i was just reading about mixers... and getting confused.
i've run some matlab programs to figure out how you can take something
at frequency x and frequency y, and end up with an output of frequency
(x-y). one transmitter's mixer i saw took a 160mhz and 14mhz input to
get a 146mhz output. adding or multiplying them together certainly does
not yeild 146mhz. so how does that work?

thanks for the help!
jason

```

You are partly correct. If audio tones are fed into the microphone input (audio stages) of an AM or FM transmitter you are generating AFSK. If an audio tone is fed into a SSB transmitter it will generate a single output frequency. If the tone is switched off and on , it will be received as a CW transmitter being keyed off and on. Some newer transceivers generate CW this way. If the tone is shifted in frequency , the output will be a carrier shifted the same ammount. This is received the same as a FSK transmitter. You can get the same effect if you have a crystal controled transmiter and switch a capacitor across the crystal to change the frequency.
There is almost no way to tell the differance between the two. If 100% pure tones are used and everything else it 100% correct then there is no differance in the transmitted signals. As always nothing is 100% and you can tell the differance with very close and strong signals. This is still close enough it does not matter.

You need a nonlinear function in order to get mixing behavior, and
create the sum and difference frequencies.

If you just add (e.g.) sin 160x and sin 14x, you end up with a simple
sum of sins, and no other frequencies show up - ordinary superposition.

Run the resulting sum through a nonlinear function (e.g. square it, or
take the square root, or clip it whenever its absolute value exceeds
1.0, or something like that), and take a look at the frequency content
of what you get as a result.

>I believe he meant AFSK (audio frequency shift keying) vs FSK (frequency
>shift keying).

The ITU emission designators for some digital modes and some typical usage:

* A1A   On/Off keying for manual reception (Morse)

* A1D   ASK, Amplitude shift keying. The only recent use I have seen is in some 433 MHz SRD (Short Range Devices)

* F1D   Pure FSK (RTTY is classified as F1B)

* F2D   Audio subcarrier modulated by amplitude or frequency (e.g. 1200 bit/s AX.25 packet) modulating an FM transmitter

* A2A   Audio subcarrier on/off modulated by Morse code modulating an AM transmitter (e.g. aeronautical beacons in the LF band)

* A2D   Audio subcarrier modulated by amplitude or frequency modulating an AM transmitter

* J2A   Audio subcarrier on/off modulated by Morse code modulating an SSB transmitter (many amateur multimode rigs)

* J2D   Audio subcarrier modulated by amplitude or frequency (e.g. 300 bit/s AX.25 packet) modulating an SSB transmitter

On the air A1A and J2A are equivalent.

On the air F1D and J2A are equivalent and can be generated and detected in both ways.

I hope this clarifies some of the issues.

What's involved in replacing the final output stage on a Yaesu VX5R HT?
What would be a reasonable price for a repair shop to charge for performing
this task?

That is not correct either. AFSK is used extensively with Amateur Radio digital systems, such as PSK-31, RTTY, even CW can be and is generated using AFSK. And the modulation METHOD is not important. It can be either Amplitude or Frequency Modulation.

>

That is a fair question, and one which is frequently asked.

Look up the trig identity for (sin a)(sin b). Let a and b each be in the form wt [w stands for greek lower case omega], so a = 2(pi)f1(t) and b = 2(pi)f2(t) where f1 and f2 are your two frequencies in Hz.   Do the substitution & algebra on the identity, and then I think you'll see where the signals at the sum and difference of frequencies f1 and f2 come from. :-)

The name "mixer" can be a little misleading.....it doesn't necessarily just sum the two inputs in a linear fashion (by just adding them, like a kitchen mixer combines the ingredients for a cake) but there is also an element of non-linearity in the electrical network.

Depending on the nature of the non-linearity, mixing can also generate other higher-order products, like signals at 2f1+f2, 2f1-f2, etc. Whether this is good or bad depends on your particular application. For example, do some reading on "intermod".

Searching for an AM radio:

My only concern is best AM reception inside concrete or steel buildings and warehouses, can not add additional antennas.

Which is the better choice between these two radios:

CCRadio plus

http://www.ccrane.com/ccradio-plus-am-fm-radio.aspx

or

Grundig S350

http://www.etoncorp.com/US/products/product.aspx?catid=2&subcatid=5&prodid=24

Your feedback is greatly appreciated.

Please respond directly to hobenzy@yahoo.com

Concrete shouldn't be a problem unless it has tons of metal rebar. Aluminum siding is bad. Anything that conducts electricity tends to block radio waves of any wavelength. If all you want is AM band, just get a cheapo $5 am band radio, the Grundig is a shortwave set that's designed primarily for the shortwave band.

For many years I've stored most of my batteries in the refrigerator,
that be alkaline, li-ion, Ni-Cad, NiMH, lead-acid, all types. And I can
say that it greatly prolongs their life.

Now I'm wondering if it might be better yet to store them in the
freezer. Does anyone here know?

Thanks for your help.

Bruce AF8F

According to Battery University, batteries should normally be stored at
59 deg F. See here: http://www.batteryuniversity.com/partone-19.htm

Of course, you also need a kind Amateur who has a computer and a broadband
internet connection, and who has donated his/her own time, equipment and
knowledge to provide a service for the rest of us.

I have four computers in my shack/living room, one of which is connected to
the HF radio and is currently providing an SSTV repeater on 7033KHz.

I have started a new ham radio website: http://callcq.com. Please visit
and post any ads for equipment you need to sale. I will accept links to
eBay as long as it is amateur radio related. Let me know of anything
you would want to see added. You can send me an email by visiting the
site. I don't collect any information except for the ad's where I ask
for your name and email address. No cookies or any other information is
collected. The site is "All Ages" rated and will never have any
inappropriate material on the site.

Please visit and thanks for looking!
73's
Chuck

Well, yeah, but from the users point of view all you need is a radio (on the
appropriate band) and power supply, antenna and co-ax, and something that
generates DTMF tones. The user doesn't need a computer or internet
connection, or even a phone line for that matter!!

>

Ahh - wasn't the removal of the HF restriction of us limited's the best
thing to happen to us of late!!! Of course, the Walts of th world still
think we shouldn't even be on any band, we didn't have to do CW....

Yes, Jock, I guess I am a fool for thinking I could help people like you.
OK, time to turn off the radios, take down the antennas, turn off the
computers, hand in the licence and sit down and vegetate in front of the
telly for the rest of me natural.

Kate

Of course it's harder on HF, but given I don't yet own any HF gear, except the 27MHz CB, I can only make contacts using 2/70cm amateur band. Without IRLP I would have only made contacts woth VK3, VK7 and maybe VK5, with IRLP I've worked VE, ZL, K, JA, YI, and I look forward to working them on HF in the future.

Of course, making a DX Contact on CB 35 LSB would be harder than making an IRLP contact, but as IRLP is the only method I have of accessing hams outside VK on the air, then I will use it.

Or I could try making contacts with hams via HF, using CB..wonder how many hams I'll find there?

```

I need help wiring the Astatic Silver Eagle
to my IC-746.

Also, is it harmful to wire the Astatic D104
handheld to this radio ?   (Power Mic).

Icom IC-746 Microphone Wiring
1 - MIC input
2 - +8 V DC output
3 - Frequency up/down
4 - Main readout squelch switch
5 - PTT
6 - Ground (PTT)
7 - Ground (MIC)
8 - AF out (varies with [AF])

Silver Eagle Microphone Wiring
1 - Shield
2 - Audio
3 - Transmit
4 - Receive
5 - Channel Up
6 - Channel Down

Help Is Always Appreciated

Posting this for a friend.

He has an old AEA PK-232 unit and a new computer with Windows XP. He is wondering what software folks are using to run this unit, if anyone still is. Any info would be greatly appreciated.

Sam - K7SAM

does this also mean we cannot place the receiver
for 10M some distance away(1Km) to stop desensitisng
the receiver as the of set is narrow, the receiver and
transmitter are connected by landline ?????????.

Dans' main problem was that he did not fully (or even partly) understand the operation of IRLP and the security systems designed to prevent access. I don't think he understood Echolink either and had the two confused as being one and the same animal.

Walt was just plain ignorant.

Brad.

Correct....in fact I think IRLP is the best choice if one is going to use
any form of internet with ham radio.

I'll keep this simple.

I have a mobile radio mounted in my car. It's an Icom 207H 2m Mobile. I need to somehow (as easily, cheaply, and quickly reversible as possible) restrict the transmit distance to something quite short (say, between 50 and 200 feet, at the maximum). What's the best and easiest way to do this, while still keeping something that can be easily reversed?

Will simply running the radio on low power (5W) with no antenna do the
trick, keeping in mind that the radio is inside a metal car? Or should
I somehow shield the end of the coax and/or the body of the radio?

It will only be used to transmit in fairly short bursts, say 10 seconds
max, and at the maximum one burst per hour or two.

Thanks,
A newbie,

J. Antman

A dummy load should suit that purpose.. even the best shielded ones should
have enough leakage to be heard that far.

Disconnect radio from antenna.

Connect radio to good-quality VHF-rated dummy load.

>Will simply running the radio on low power (5W) with no antenna do the
>trick, keeping in mind that the radio is inside a metal car?

It will quite possibly damage the radio's RF finals. Some radios have
good high-SWR protection, others do not. How lucky to you feel today?

Use a dummy load, and minimum transmit power. Enough RF will leak out

of the radio and coax to allow you to hear it tolerably well over
short distances, and it should pick up enough of whatever signal you
transmit from an HT to be able to receive well enough.

> Or should
>I somehow shield the end of the coax and/or the body of the radio?

terminate the end of the coax with a 50-ohm dummy load.

There is a strong possibility that if you operate the rig with a dead short or open for the antenna that you will kill the finals more quickly than you think.

Use a dummy load and see if that helps. Additionally, you may get enough 1 watt resistors to put in parallel to make up 50 ohms at 5 or more watts. That will work well and not risk damage to your rig.

using the dummy load inside the car will probably still allow it to ttransmit outside for quite a ways.

Good luck
Buck

> I have a mobile radio mounted in my car. It's an Icom 207H 2m Mobile. I need to somehow (as easily, cheaply, and quickly reversible as possible) restrict the transmit distance to something quite short (say, between 50 and 200 feet, at the maximum). What's the best and easiest way to do this, while still keeping something that can be easily reversed?

Attach a good quality dummy load to the antenna connector, and make sure your TX power is set at low. That should keep the emissions down.

> Will simply running the radio on low power (5W) with no antenna do the trick, keeping in mind that the radio is inside a metal car? Or should I somehow shield the end of the coax and/or the body of the radio?

If you value your radio's transmitter stages, NEVER run it without either an antenna or dummy load. Period.

Was that not covered in your ham radio license study material?

Thanks to everyone for the replies. It turns out that the whole thing no longer matters. The idea was to use the rig to activate a nearby relay, based off of an old, re-programmed Motorola Minitor-II two-tone paging reciever. However, I'm having some issues triggering the pager, so the project is scrapped.

Thanks to all for the advice. When I place my next order from one of the dealers, I'll buy a good dummy load in case I ever need it again.

Bruce - yes, I'm sure it was covered somewhere. But I was more worried about getting the numbers and formulas and physics for the test, and had no problem remembering the 'easy' stuff...when taking a test at least.

I loved the storage boxes made by Rubbermaid up until about four years ago. These were sturdy boxes, and most of them had latches on the top lids. Some lids were completely removable, and some were hinged, but all were equipped with latches.

One of the Rubbermaid boxes that I liked a lot was the Totelocker # 2156. Another one was the # 4151 Latch Tote. There were others that I would also like to buy used.

The Rubbermaid boxes sold now are paper thin, and without latches. They are unsuitable for my purposes.

If anyone on these lists to which this request is sent have any of these boxes, I would like to see if we could agree on a purchase.

Please reply to me off list, at my email address below.

Thank you very much !!

Based on what you're saying, I have a hunch what are you trying to do, is
test the Minitor with a 2 meter rig? I am betting you were using a "PL" tone
to try to open it up to receive. Not sure what you know about Minitor IIs,
but there are probably no less than 2 reeds in it. A "single" tone, won't do
it. And you couldn't possibly switch tones fast enough to make it work. It
is milliseconds of a difference. If you'd like some help with the Minitor
II, give me a yell privately. I repair them all the time.

You mean like this? http://www.mailcartofficesupplies.com/index.html
I just use some bungee cord for the boxes I use outside...but I had to
look...

My bad, FAs should only be posted to the .swap and .marketplace groups which were created for ads and let discussion groups be for discussion. However it seems that everyone who has something to sell on ebay thinks all groups were created so they would have a place to hawk their junk in hopes of getting an extra dollar. As can be seen, these FA were spammed to multiple groups without regards to the type of group.

You're crying about an auction that ended 2 months ago?
Seems to me that the bay is here to stay.
Learn to use your filters.
Seems to be the only way for you not to see them.
Also, one mans junk in another mans treasure............
It also seems that people who view these newsgroups
might be curious as to what's for sale elsewhere.
Many have gotten stuck buying on these groups with broken items.
If someone has integrity there is usually not a problem, but there is the
other side of the coin where broken items were sold. The new owner has no
recourse. At least on ebay there is feedback, not a perfect system but
one that works.
And with paypal you CAN get a refund a good part of the time if there is
a problem.
Been there and done that.

So why post FAs in groups that are for discussion? That is what the
.swap and .marketplace groups are for. Why should I have to filter out
FAs in a discussion group where FAs shouldn't be there in the first
place? If people in a discussion group are curious about what may be for
sale on ebay then they can check the .swap or .marketplace groups or go
to ebay and search, it ain't rocket surgery.
Look at the boatanchor group as an example, which was set up to DISCUSS
boatanchor type equipment, along comes the ebayers with a few FAs, then
someone else sees the FAs, posts their FAs and pretty soon the group is
more FA ads than discussion.

That's a good point. It use to piss me off when these FA started to
show up on the groups.
We can still discuss stuff here but it seems it is the way of the world.
It's like the price of gas, nobody likes it, but it keeps going up and
we still have to buy it.

    It is called spam.  Especially, when they cross-post to so many groups.
    I just look at it like this...if they can't seem to follow netiquette,
then I don't want to do business with them.  Unfortunately, there are so
many people online that are ignorant, it will never go away.  So, I just
report them.

Hello fellow amateurs.

I've had my FT-847 for about 4 years, used it very lightly.

Recently I've experienced very strange audio reception. When I listen to some VHF repeaters (after TXing) I hear strong and very annoying "scrambled eggs" or " popcorn" sound. It's most usually on the repeaters I receive lower then S-5. This is very elusive and happens rarely, and it's always unpredictable when it will kick in. When I listen to the

same freq. on a scanner, the audio is clear and hams I spoke w/ on the
repeater don't experience this sound. This narrows it down to the
reception inside my radio.

Any help concerning this would be greatly appreciated.

73's.
Phil

THIS POST HAS INSTRUCTIONS FOR SOME FIELD PROGRAMMABLE RADIOS

** MOTOROLA - XTN, M SERIES, SPIRIT GT AND JOB COM **

XTN

HOW TO PROGRAM THE XTN&#8482; RADIOS:

1. To enter programming mode hold down "PUSH-TO-TALK" switch on the side and the "MONITOR" button on the front while turning radio on . The PROG icon will be displayed.

2. Press "MENU" once to program operating frequency. To set operating frequency use the + and - buttons to cycle through the frequency codes available.

3. To set "PL" or "DPL" press "MENU" button, the Code number display will flash. Use the + and - buttons to select from the 38 PL codes and 83 DPL codes (including 0 for CSQ users).

4. To select Bandwidth (when FCC allowable) to match existing equipment press "MENU" again. 6 will be displayed. Bandwidth is only selectable when "Lo" or "Hi" is flashing. Use + and - to select bandwidth. See below chart for frequencies which have selectable bandwidth.

5. To enable or disable "Manager Lock" press "MENU" button again. A small lock will be displayed. Press + and - to select "y" or "n". Press "MENU" button again to return to standard operating mode.

6. On multi-channel radios repeat for each additional channel; PL and DPL codes can be different for each channel.

Other info
Roger Beep - turn on radio and push +
XV1100 & XU1100 are 1 channel only, no scan, no encryption
programming mode:
    O with \ in the middle = scramble feature
    G = mic gain (1 low sensitivity - 3 high sensitivity)
    CA = call tones

to exit prog mode press and hold PTT

M SERIES

HOW TO PROGRAM THE M-SERIES RADIOS:
To enter programming mode hold down "PUSH-TO-TALK" switch on side while turning radio on .
To set operating frequency cycle the "PUSH-TO-TALK" button to select one of the eight frequency codes shown below for F1. Voice prompts will announce each channel as you scroll through.

Next to set "PL" code press "MONITOR" button inside the Push-to-talk bar once. Then cycle the "PUSH-TO-TALK" button to select one of the 38 PL codes (including "off" for CSQ users) shown below. Voice prompts will announce each code as you scroll through.
Press "MONITOR" to return to standard operating mode.
On multi-channel radios repeat for each additional channel; the PL code is the same radio-wide.

SPIRIT GT

 HOW TO PROGRAM THE NEW GT SERIES RADIOS:
Single channel GT model:

To enter programming mode hold down "PUSH-TO-TALK" switch on face of radio while turning radio on for 5 seconds.
To set operating frequency use "SCROLL" button to select one of the eight frequency codes shown below for F1.
Next to set "PL" code press "MENU" button once and the "SCROLL" to select one of 38 PL codes (including "off" for CSQ users) from table shown below.
Press "PUSH-TO-TALK" to return to standard operating mode.
Two channel GT + model (channels 1 & 2 share one common PL value)

To enter programming mode hold down "PUSH-TO-TALK" switch while turning radio on for 5 seconds.
To set operating frequency for channel F1 use "SCROLL" button to

select one of the eight frequency codes shown below.
Press "MON" button once, "SCROLL" to channel "F2," to reenter programming mode press "MON" button a second time.
To set operating frequency for channel F2 use "SCROLL" button to select one of the eight frequency codes shown below.
"PL" code is the same for both channels. To set "PL" code for both channels press "MENU" button once and the "SCROLL" to select one of 38 PL codes (including "off" for CSQ users) from table shown below. The PL code is the same for all channels radio-wide.
Press "PUSH-TO-TALK" to return to standard operating mode.

JOB COM

How To Program Your Jobcom JBS Radio

Choose your frequency and tone codes to match your existing radio system.

Each channel will require the entry of 4 digits. 2 digits select the operating frequency; 2 digits select the PL tone value. (Programming channel 2 is optional.) The value 0 in a Ritron Code is entered through 10 clicks on the PTT button.

To enter programming mode:

1. Turn radio on.

2. Press and hold "Off" button until "Off" tones are heard then release.

3. Press and hold simultaneously both "Push-To-Talk" button and "On" button. The base radio will begin to beep rapidly. Continue holding both buttons until beeping stops, then release both buttons.

Enter frequency and tone codes with push to talk button. For example, frequency 154.600 corresponds to Ritron Code 01 and a PL code of 179.9 equals a Ritron Code of 29. To program this example you need to press the "PTT" ten times, pause, then the radio sounds a low tone. Now press the "PTT" one time; the radio sounds another low tone. The frequency codes has been entered.

Now enter the PL value by pressing "PTT" 2 times, pause for the tone, then press the "PTT" nine times and pause for the tone.

(Continue in the same manner if a second channel is to be programmed. If only one channel is programmed proceed to next step.)

4. When all values are programmed press "On/Volume Up" button to save programming information. The radio sounds a triple beep confirming successful programming.

Hi -

Is there a suitable USENET NEWSGROUP where someone
could post and request binary files of HAM RADIO MANUALS?

Please reply here if you know.

Http://www.mods.dk has quite a number of amatuer radio manuals,
including service manuals and modification information. If you have
any that are not listed, contact the website administrator and see if
they want them.

new 2m repeater on space station
a new 2m repeater is now operating on the
international space station 24 x 7
the uplink is on uhf 437.800 and the downlink is on vhf 145.800
no tone burst or ctcss is required
the radio is a kenwood tmd700 operating in remote crossband mode
it just retransmits on vhf what it hears on uhf
so if you are getting through you can hear yourself
on the downlink

anyone can work it using a co-linear

to see where the space station is 'live' check

http://science.nasa.gov/temp/StationLoc.html

for 3 days in advance predictions download the pcsat decoder program

http://www.ui-view.com/uiview32/pcdec242.msi

when the iss repeater is being worked the audio may be streamed in the
amsat
conference server on echolink so anyone anywhere in the world can
listen in

I was looking at ebay and saw a nice Kenwood TS-680S that you dont see
around much any more,, and though people here should have a look if
they are looking for such a nice radio. Happy Dx'ing to all here.

Well I hope you get your license, it's even more fun when you can transmit. Do you use some kind of tuner with your 15 ft SWL antenna? your ant is perfect for listening in on the 20 Meter band but you're missing a lot of week signals on any frequencies other than those centered around 15.6 MHz.

For the code test, sending is NOT required. Today there are only three levels of license: Tech, General, and Extra.

Tech: Must pass the element 2 written test. Gives you all privileges above 30 megaherz. If you also take the element 1 code test (5wpm, receive only), you will have the old Novice HF privileges in addition to your VHF/UHF privileges.

General: Must pass element 1, element 2, and element 3 (a written test).

Extra: Must pass element 1, element 2, element 3, and element 4 (a written test).

Note that the Tech license gives you credit for element 2. The General license gives you credit for elements 1, 2, and 3. In other words you don't have to retake an element for which you have credit. If you can find your old Novice ticket, it will give you credit for element 1 even if expired. However higher class tickets that have expired don't give you credit for anything.

The Advanced ticket is no longer being issued so to get the privileges you used to have as an Advanced, you may want to go for the Extra. It is possible to do this in one test sitting if you are prepared as you can take the next test as soon as you pass the previous test. You don't have to wait for your ticket to test for higher classes.

Study guides can be obtained from the ARRL (www.arrl.org) and W5YI (www.w5yi.org). The ARRL guides explain the material quite thoroughly plus include the question and answer pool. The W5YI study guides simply give the question and answer pool with very brief explanations. For those who have never been a ham, I recommend the ARRL set of guides. In your case, perhaps the W5YI guides might be sufficient. Note that the question and answer pools are publicly available. In each case the pool of possible questions is several hundred but only 35 questions are on the Tech and General tests while there are 50 on the Extra test. You can take practice tests online (see www.eham.net and www.qrz.com). The practice tests are randomly generated so no two are alike. You might want to try them while you wait for your study guides to arrive to see where you stand and what material you will need to review more intensely

They will also have lists of test locations, contacts, and local clubs. However, since many clubs only publish their test schedule locally, you might want to find a local club and get information on the availability of tests in your area. If they don't list one in your area, simply do a web search using the name of your local large city and the words "amateur radio." If your are in the San Diego area, search for SANDARC. They are an organization of clubs in that area and do their own testing, i.e. they are a Volunteer Exam Coordinator (VEC) themselves and so do not go through ARRL or W5YI and will not be listed on the latter web sites. However all VECs use the same question pool to generate exams so the study guides for one are valid for all.

Dee D. Flint, N8UZE

hi all
well i was reading your messages and here too we are and having  some fans
of packet too.
we have lost many users but i am still runing the bbs VE2RXY on 145.010
with some nodes .
i am looking for some partners for my bbs to forward via internet ,can
someone QSP my message at the sysop of your bbs,maybe we can establish a
link between our bbs,s if you have an internet forwarding procedure?

Many radio-amateur  have left the packet around the province since ,some
years ago,an organisation ,said that packet is obsolete,,,they didnot
understood that it can be used for emergencies anytime and at low cost and
with resonable coverage .We dont want it but the test of emergency
communication happens in emergency,desaster  so if we were too have
one,,,there,,,organisations,,would consider our passion for his right
potentiel.

So keep the passion,maybe the quality of the network of nodes and bbs that
we will meet on packet

Hi, I'm wanting to get into SW listening but I'm torn betwen those 2 models and I'm not 100% sure what characgteristics are the most/least relevant of each.

Which radio would be best for a noob getting into SW anew?

If not those, what other radio and why? I only have about six-hundred bucks to spend.

Thanks

Both are good receivers. Satellit has some properties that R75 doesn't
have - and vice versa.

I would buy the R75 because it may be the right choice in the long run
for my shortwave oriented listening and I have only little experience in
such world band radios like Satellit. Not to forget that I am a radio
amateur and my needs are different in *that* direction.

Satellit has a good FM band and its audio quality is superb, it is easy to
use. R75 has more SW "possibilities", say, after modifications at least,
and its "cost efficiency" is very, very good.

Also, good used equipment can be found, other than those mentioned,
to satisfy the listening needs *and* the wallet.

Hard to decide. Which are your aims?

If you're just getting started, I wouldn't recommend either the 800 or the R-75. I would recommend the SW7600GR. You can get one for under $200 and it's a fine little readio. Use it with 20 or 30 feet of wire out the window and you'll be off and running. It also has SSB capabilitites, which you should familiarize yourself with even if you're primarily interested in broadcast listening.

If you've had the SW7600GR for a while and find that your enthusiasm for shortwave listening continues to grow, then consider moving up. I personally wouldn't recommend the Eton Satellit 800, though (unless you can get a really good deal on a used one). My experience with it (which is contradicted by the experience of many others) has been disappointing. Besides, it's not really a portable and there are vastly superior units (like the R-75) in essentially the same price range.

If you want to mess around remotely with an R-75 just to see what you can see, go here: http://www.ralabs.com/webradio/.

Best,

Steve

If his budget is $600, he might be one of those folks who wants to make sure any problems he has can't be blamed on the radio.

Having started in the hobby several times before figuring out my problem was the radios I was buying weren't good enough for my expectations, I don't blame him.

The Sony gets good reviews for a portable, but it doesn't have features the other radios he's looking at have.

Radios I'd look at in that range include a used Drake R8 or R8a.

Personally, I'd avoid the Sat 800 because of build quality concerns, and because I figure it's too large for what it is.

TEMPEST,

I Am Glad You Asked :o)

If you are a International Shortwave "Program Listener"; also
enjoy AM/MW Talk Radio and FM Music Listening; then consider
the Grundig Satellit 800 M.

If your are a primarily interested in Shortwave and HAM Radio
"DXing" and not very interested in AM/MW Talk Radio and FM
Music Listening; then consider the Icom IC-R75 Receiver.

If you still can not decide - Buy Both :o) ~ RHF

I would go with the R-75 because it has more tools to help dig out
signals.
The ICOM will be more difficult for a newbie to learn but things like
RF gain, pass band, and noise blankers can be very helpful.
    If you need good audio get an external speaker or a garage sale
boom box with a few short wave bands on it. Some of them sound better

than the S-800 on strong signals and usually cost under $10.00. People get rid of them because the tape player no longer works.

Bob

Frankly, I believe that it takes a lot of balls to post an ad for a Korean made product and include a waving American Flag and a cartoon character that proclaims "Go America" in that same ad.

Do you totally lack common sense, or just so shameless in your pursuit of a sale that you don't care?

Harry C.

Nahhh, it just takes a little willful ignorance.

Why not become a Ham Radio Operator? As a Ham Operator, you can talk with other Hams all over the world using frequency bands within the shortwave radio spectrum. Depending on your license class, you can send data, Morse Code and Images as well as voice. You can get a great used Ham Radio rig with built in shortwave receive for around $500.00 or less. Sure, you wont get syncronous AM detection, TAPE Output, or clock / timer functions but the receiver section will be at least as good as the better SWL receivers on the market. The Kenwood TS-450S/AT would make a great Ham radio transceiver and a SWL receiver. Plus it has 100 memory channels so you can program your favorite SWL stations.

No, I drive a Ford Bronco and my ham rigs includes a Barker &
Williamson 5100 transmitter and a Hallicrafters SX-71 receiver.
Everything else is home constructed, including 2-M and 420-Mhz rigs.
(I am now in the market for a mint condition Collins 75A4!)

I simply objected to you waving the American flag in your desperate
attempt to sell a inexpensive, foreign made, non-repairable and
throw-away consumer item.

                                             Harry C.

I agree with you in general, but I suspect a significant percentage of
real hams reject this and remain loyal to quality American made radio
products that, although costly, at least can be repaired and
maintained. This is why used products like the Collins 75A4 and even
Heathkit products continue to command high prices. When they break,
you can fix them.

It's not entirely a patriotic thing with me. I simply wouldn't want to
```

own any ham equipment that I can't maintain and repair myself under emergency conditions. In fact, this is something that was traditional in amateur radio until very recently.

Harry C.

OH PLEASE, YET ANOTHER VIRUS ATTEMPT.
YOU MUST THINK WE ARE ASSHOLES.
LET ME GUESS, KERRY NEXT WEEK??

news@CNN.com wrote:

> Early this morning two CNN Journalists discovered the CCTV footage that will shock the world. At 3.29am President George Bush was shot dead by an Islamic Militant suspected of working for Al-Qaida. As yet to be released to the nation due to the governments concerns over national Security, CNN has decided to inform the public of this terrible event. A short CCTV clip as evidence of this tragedy has been posted here and there will be more updates to follow as the news filters through.

I have a Grundig Rossini from about 1962 and I was wondering if anyone has suggestions on where to buy or how to build a good power antenna for the short-wave radio.

Any advice will be appreciated.

Thanks,

Ashley

I know little about active antennae except that if you absolutely *must*
use one, use a loop.

Any input on getting an Ameritron 811 to work with a Yaesu Ft-767?

I have all cables hooked properly, the amp is in excellent shape and works.
All meters work, the fan runs, and all cables are double checked for

continuity.

The manual with the 767 says that when I run the relay cable from the amp to the TX Grnd jack on the Yaesu that I must locate and turn to "on" a switch they call the S2002 switch on the RF section (inside the rig) to activate the amp.

Where the heck is this switch? The Yaesu manual doesn't show the location. In fact, the 767 manual stinks.

The Ameritron manual also states that it is not necessary to hook the ALC cable to the rig unless I run more than 70 watts at the transmitter.

Any input will be appreciated.

echolink iss live feed 1647utc monday 28th feb 2005

A live feed of the ISS contact with a school in Bentley CA will be sent live into the AMSAT conference room, Echo Link node 101377 by Dieter, KX4Y. The contact between the ISS and school starts at 16:47 UTC and lasts for about 15 minutes +/-. During this contact, we appreciate everyone's patience and understanding. We must mute everyone except Dieter, KX4Y to avoid inadvertent, interfering transmissions into the conference room. Thanks for your understanding and cooperation.

American hams in the footprint can listen on 145.800 FM to the 'live'
downlink audio

I'm considering the purchase of some VX-150 Accessories. These
include the high capacity battery with the desktop charger as well as
the mic/speaker.

Does anyone have any comments with regard to OEM vs aftermarket?

If aftermarket, please give specifics as to brand/model and supplier.

Thanks

Rich

At some point I'm going to have to graduate from the VX-150 for base operations.

One of the rigs that I'm considering is an FT-7800R with an Astron VS-35M power supply.

Any thoughts on this combo?

Any alternate suggestions?

Thanks,

Rich

Not on the combination itself, only on the FT-7800R. If you are over 30 years old I would recommend you look for some other rig. I guess that as a radio it's ok. It cheap, enough Power output and a decent receiver as far as I'm able to tell. What I have against it is that there are too few buttons, which mean that you will have several functions on the same key. Press short for one thing, long for another poke around in some menu and the buttons suddenly have another meaning. I'm 36 and I doubt that I will ever learn which of the buttons on the mic that give me the repeater tone, and which changes from simplex to duplex. If you are younger you will no doubt be able to learn. Due to this I only use mine for APRS and DX-cluster operation. That way it's mostly set and forget.

Rich,

I would recommend getting an all band/mode receiver (i.e.. Icom 706,Yaesu
FT-857) if you can afford it.  If you only have Tech privileges, you can
monitor HF and short-wave.  You might get motivated to upgrade and you would
be covered by having a radio that can operate on HF.  BTW,  I own a 7800
that I use mobile. I never have had any problems with it.  I love the
wideband capabilities of this radio.  The computer cable and software for
programming is a must with this radio.

73,
W2USB

: I suspect he meant 'fret' ... but in some parts of the UK, 'threat' is

yes... i 'saw' the mistake.
its a pity though that those who claim superiour spelling skills and used
to try and have a go at me cant apply those same standards to others and
by doing so avoid the accusation of being two-faced.

A friend has a Knight T175 amplifier and as soon as he turns it on, it keys up and will not sit in standby mode with or without a radio attached.

Any ideas ?

Well from what I have seen of Australian rules football it's likely that the
player's balls were kicked right up their entr�e prenerous (sod the
spelling) Next time you watch a game be sure to check if the players walk
funny and have squeaky voices. It brings a whole new meaning to "lump in the
throat" :)

There are rules? I thought it was a free for all. It makes me wonder if they throw the ball on just to make it look like a ball game in the sporting sense and not of mindless violence. Compared to Australian football the roman gladiators were tame.

I am trying to eliminate a telco connection from a repeater voter site by
using VOIP. I have good network connectivity.

I would like to take two computer and set them up dedicated with linux (most
likely Fedora - command line only).

Have line input on computer 1 --> speaker output on computer 2

Very simple application. I need it to boot and auto connect, and reconnect
if it looses connection for unmanned operation.

Anyone know of such as app?

Depends on where you are standing, and where the other radio is located, and what is in between..

2 meter is more-or-less line of sight, and 5 watts will get out a ways.

At a regular elevation, I can hit repeaters 10-20 miles away. Simplex I can usually get several miles, but this area has many hills, so it is less predictable.

From a 3200 foot summit, I have worked simplex 40 plus miles away, and repeaters 60 plus miles away, with a clear signal.

Note that I have replaced the stock antenna with a 1/4 wave one.

Happy trails,
Gary (net.yogi.bear)

when you say 2 meter

don't you really mean

2 meterS   ??????????????

Where on earth did   "2 meter"   come from ???

IF it is more than one meter, then it is meterS

Examples:

1 meter

2 meters

3 meters

etc etc etc

Good Luck !!

Many hams use the same thing to describe that band.

Do you use your radio on the 2 meter band, or on the 2 meterS band?

I am sorry to confuse you so much by using a term so hard for you to understand.

Happy trails,
Gary (net.yogi.bear)

I wouldn't know. Not ever active with CB, although I do have one in my
random emergency radios.

It is the term that I hear hundreds of hams using 2 meter gear use.
May not be grammatically correct, but is common usage.

One could also think of it as an adjective form rather than a noun
form.

But I wouldn't want to interfere with your campaign against everyone
who is not exactly like you.

I did note that your additions to this thread had exactly zero to do
with the original question.

Happy trails,
Gary (net.yogi.bear)

INTERNATIONAL SPACE STATION LIVE ON ECHOLINK MARCH 8th TUES 1410GMT

The next International Space Station's Expedition 10 ARISS school contact will be with students at Rains High School in Emory, Texas on Tuesday, 8 March 2005. The event is scheduled to begin at approximately 14:10 GMT.

This contact will be a telebridge between stations NA1SS and WH6PN in Honolulu, Hawai'i, so it should be audible to anyone in the areas of the Pacific near the islands listening in on the 145.80 MHz downlink. The participants will conduct the conversation in English.

"Rains High School, a county school located in one of the smallest counties in Texas, is comprised of mostly low-income students who often do not get the opportunity to participate in enriching programs. The opportunity to talk with the astronauts on the International Space Station will expose our students to a world that exists beyond the boundaries of Rains County. The questions asked of the astronauts and the ideas generated by the answers will be used as jumping off points for further discussion and research."

Audio should be available for this contact Via EchoLink in the following conference rooms:

AMSAT node 101377
EDU_NET node 77992
See further notes below
Via IRLP Reflector REF9307 starting at 14:00 UTC
REGISTRATION REQUIRED (see below)
Via the internet:
URL: https://e-meetings.mci.com/
CONFERENCE NUMBER: 6037948
PASSCODE: SPACE STATIO

Students will ask as many of the following questions as time allows:

1. How would a baby's development in the womb differ if the mother were in space?
2. What do you think will be the greatest technological advancement that will come out of the research you all are doing now?
3. How do you monitor your radiation exposure?
4. How did you adjust to Newton's third law of motion while in space?
5. Since you have been in space so long, have you had the opportunity to notice changes that have occurred on the surface of the earth from your perspective?
6. You have learned a lot of science, but what was the one thing you did or experiment you performed, while in space, that you remembered reading or studying about in school, that made you say, "Wow, it really does work that way"?
7. Do you think people will be able to spend the rest of their lives living on the space station?
8. Could a sphere large enough to let a small fish swim in it be formed in near gravity and could a fish actually swim in it?
9. What is the material used on the space station and how safe is it from space debris?
10. Are there any lubricants on the space station and if there are, how are they affected by weightlessness?
11. Have there been any new discoveries by researchers in space concerning the Texas state molecule, The Bucky Ball, C-60?
12. Are you allowed to carry person items and if so, is there a rule on how much you can take?
13. Do you ever get to review the final results of the experiments you help to conduct on the ISS?
14. What does it feel like when the shuttle takes off? Does it hurt?
15. If you were to push a hot wheels car on a circular loop in space in the space station, would it go forever and maintain the same speed?

Please note, the amateur equipment on the ISS will be turned off prior to the beginning of the contact. It will be returned to service as quickly as possible.

ARISS is an international educational outreach program partnering the participating space agencies, NASA, Russian Space Agency, ESA, CNES, JAXA, and CSA, with the AMSAT and IARU organisations from participating countries. ARISS offers an opportunity for students to experience the excitement of Amateur Radio by talking directly with crewmembers on-board the International Space Station.

Teachers, parents and communities see, first hand, how Amateur Radio and crewmembers on ISS can energize youngsters' interest in science, technology, and learning.

Further information on the ARISS programme is available on the website http://www.rac.ca/ariss (graciously hosted by the Radio Amateurs of Canada). Information about the next scheduled ARISS contact can be found at http://www.rac.ca/ariss/upcoming.htm#NextContact.

IRLP Notes
Participation in this contact is limited to 20 connections and requires pre-registration.
Please contact Wayne, VE1WPH, via e-mail at ve1wph@rac.ca for pre-registration and connection instructions.

EchoLink Notes
The contact between the ISS and school lasts for about 15 minutes +/-. During this contact, we appreciate everyone's patience and understanding. We must mute everyone except Dieter, KX4Y to avoid inadvertent, interfering transmissions into the conference room. Thanks for your understanding and co-operation.

Thank you & 73,
Scott H. Stevens / N3ASA
ARISS Team Member

New XP2500A
The World's #1 Digital Satellite Television
Receiver Descrambler is Now Available to you!!!!!

Order Yours at: http://www.fta9000.3322.org

No Monthly Subscription Charges of ANY Sort!
No Service Contracts of ANY Sort!
No Telephone Connections of ANY Sort!!!!
Does NOT use ANY Sort of Satellite Access Card
The World's Number One "Cardless" Satellite Receiver!!!!

A NEW Product for the NEW Year of 2005
Our New XP2500A Digital Satellite Television Receiver Descrambler allows you to view at your convenience the following with the USA, Canada, Cuba, Bahamas, Jamaica, Virgin Islands and Mexico:

View Over 600+ Digital Television Stations FREE! (Everything!)
View Over 200+ Digital Commercial Free Music Stations FREE !(all categories)
View Over 40 Pay-Per-View Movies Channels FREE!
View 8 HBO's/5 Cinemax's/10 Showtime's/8 Starz, etc. FREE!
View Seven Adult Channels FREE FREE FREE � 24 Hours A Day (Non-Stop Action)!
Boxing/Football/Soccer/Baseball/Basketball � ALL Sports Packages FREE (With No Black Outs)!
Receive Home-Town Local Broadcast Television Stations from 4 Time Zones
Use this New Television Descrambler at Home/Office/Truck/RV etc.
Works In the USA and Canada � plus ALL of North and South America and Territories!
Works on: Nagravision, Seca, Viaccess #1 and #2, Irdeto One and Betacrypt Digital Satellite Signals!!!!

NOTE TO AUSTRAILIANS: We get many request about the Australia�s "Foxtel Channel". Our New XP2500A Receiver works nearly ANY where in the world - but it will NOT receive "Australia�s FOXTEL Broadcast Channel" as of yet.....they use Irdeto #2 a Decoding System.....so wait patiently - our Descrambling Technicians are working HARD on this one, to brake the code.
International Customers.

Our NEW XP2500A Digital Satellite Television Receiver - NOW UNSCRAMBLES THE FOLLOWING SIGNALS:

Amateur Radio Newsline™ Report 1410 - August 20, 2004

Amateur Radio Newsline report number 1410 with a release date of Friday, August 20th, 2004 to follow in 5-4-3-2-1.

The following is a Q-S-T. Ham radio is ready as Hurricane Charley comes ashore. Find out the details on Amateur Radio Newsline report number 1410 coming your way right now.

(Billboard Cart Here)

**

RESCUE RADIO: HAM RADIO AND HURRICANE CHARLEY

Packing 145-mile per hour winds Hurricane Charley slammed into west-central Florida, ravaging oceanfront homes and trailer parks, tearing apart small planes and inundating the coast. More than a half million customers were left without power or telephone service statewide. Damage was especially heavy in downtown Punta Gorda on Charlotte Harbor. Warren Elly, W1GUD, is a Tampa based TV reporter sent to cover the aftermath of Charley coming on shore:

--

Audio report only. Hear it in mp3 audio in the current newscast posted at http://www.arnewsline.org/quincy

--

Warren's report was filed early Monday the 16th. Since then President George Bush has declared some sections of Florida as a major disaster area. His brother, Florida Governor Jeb Bush, projected damage from Charley could exceed 15 billion dollars, but that estimate was preliminary. (ARNewsline(tm))

**

RESCUE RADIO RULES: FCC CLARIFIES EMERGENCY DECLARATIONS

The FCC has issued what amounts to a white paper to clarify the rules hams must follow when providing communications during an emergency. Amateur Radio Newsline's Mark Abramowicz, NT3V, is here to sort it all out:

--

With the hurricane season upon us and wildfires and other severe weather hitting various parts of the nation, the Federal Communications Commission believes now is the time for a clarification on Emergency Communications Declarations.

What is an Emergency Communications Declaration or ECD?

When a natural disaster or accident interrupts or disrupts normal communications systems in a particular area, the FCC - at the request of emergency management officials or an amateur radio operator acting on behalf of emergency officials - issues an Emergency Communications Declaration.

Essentially, the order defines special conditions and special rules to be followed by amateur radio stations providing service during the communications emergency in that particular area.

The FCC says occasionally, it receives requests for Emergency Communications Declarations before a hurricane or tropical storm hits. The FCC says such requests generally arrive anywhere from 24 to 72 hours in advance of weather predictions citing potential damage to a particular area.

But under Section 97.401(a), emergency communications before an event CAN be established to meet essential needs of a community or to help prepare relief activities. The commission acknowledges preparations to meet a disaster may overload or damage normal communications systems so it allows amateur stations to make emergency transmissions at any time prior to or even during a disaster.

In essence, the FCC says there's no need for an ECD because the actual event disrupting communications has not occurred.

So, the FCC says such declarations WILL NOT be issued until AFTER the disaster disrupts normal communications in a geographic area subject to FCC regulation.

Speaking of emergencies, it doesn't necessarily have to be a weather-related incident, as we found on September 11, 2001. It can also be a transportation accident such as a railroad incident or a fire or explosion.

Whatever the emergency, once communications are disrupted, the FCC says there are only two sources from which it will accept an application for an ECD. The first is an emergency management official responsible for communications in the affected area. The second is an amateur radio operator acting at the request of an emergency management official.

The FCC says such applications must contain very specific information such as:

- The date the event has taken place.
- The nature of the disaster.
- A description of the communications system disrupted and a contact person who can verify the damage.
- The geographic area affected - city, county, state or region.
- Listing of the VHF/UHF, MF or HF frequencies to be used during the emergency.
- An estimated time the disruption of normal communications is expected to last.

The FCC says an Emergency Communications Declaration will contain an expiration date. However, the commission says that date can be extended at the request of the emergency official or authorized party making the original request.

For the Amateur Radio Newsline, I'm Mark Abramowicz, NT3V, in Philadelphia.

--

The FCC's Communications and Crisis Management Center is the place where Emergency Communications Declaration requests are sent. You can reach them by phone at 202-418-1122, that's 202-418-1122. FAX requests are handled at 202-418-2813, 202-418-2813. Or, you can make the filing by e-mail to comm(hyphen)ctr@fcc.gov. (ARNewsline (tm))

**

EMERGING TECHNOLOGY: AUTOMATING EMERGENCY ALERTS

A new technology soon to debut in 12 states will significantly extend Amber alerts, reaching cell phones, e-mail and handheld computers. It could also be used to transmit weather and terrorism alerts.

According to news reports the system uses a simple broadcast technology that takes the information from a Web portal and reconfigures it for different types of broadcast. By way of example, a state department of transportation might receive it in one format for its road signs and another for its information number.

More important, people with cell phones can sign up to receive Amber alerts with their local county or with state authorities. The text of an alert can be sent immediately to local TV news stations and Web sites.
(Science OnLine)

**

RADIO RULES: INTERNET LINKING IN THE UK

Telecommunications regulators are about to make ham radio internet linking a lot easier on the other side of the Atlantic. This, as

Ofcom
which is the U-K equivalent of our FCC issues new and more
liberalized
rules. RSGB news presenter Jeramy Boot, G4NJH, has more:

--

Ofcom has announced the decisions it has taken about changes to the
procedure and terms of issuing Notices of Variation (NoV) for
Internet
Linking Gateways.

Ofcom proposes to pass the Internet-linking NoV process to the RSGB
to
issue NoVs on behalf of Ofcom. The RSGB will be announcing procedures
for NoV renewal shortly and queries on the
renewal process should be directed to the Society.

Ofcom's decisions were made following the notification of four
proposals
which gave those holding an NoV the opportunity to make
representations.

Jeramy Boot, G4NJH, in Nottingham.

--

For those interested the complete set of new U K Internet linking
rules
is on line at http://tinyurl.com/4LE8P (GB2RS)

**

RADIO RULES: VANITY FEE REMINDER

Back here in the USA, a reminder from the FCC that the new Amateur
Radio
vanity call sign fee of $20.80 for the 10-year license term became
effective on Tuesday, August 10th. Not on Friday, August 6 as we and
and others had announced.

The reason for the last minute change? A management-level staffer in the FCC's Office of Managing Director explained to the ARRL that the Commission was not necessarily bound by the August 6 effective date The Federal Register indicates. That date was 30 days after publication of the order containing the new fee schedule. (ARRL, FCC)

**

ENFORCEMENT: NO LICENSE - STAY OFF THE AIR

Meantime the FCC has written to a pair of unlicensed operators telling them to stay off the air. The agency's Daryl Duckworth, NNZ0W, explains:

--

Duckworth: A warning notice went to Rick Shepherd of Crescent City, California for unlicensed operation on 146.515 MHz along the Oregon/California border aboard the fishing vessel Sunset.

David Shoemaker of Sebina, Ohio, also apparently not in the FCC Licensing Database was issued a warning notice for unlicensed operation from a vehicle with license plates registered in his name. The transmissions were on 28.085 MHz near the intersection of I-71 and U.S. 36.

--

Shepherd and Shoemaker were both told that operation of radio transmitting equipment without a license is a violation of Section 301 of the Communications Act of 1934. They were also informed that continued operation could lead to fine or imprisonment, as well as seizure of any non-certified radio transmitting equipment that they own. Monetary forfeitures for unlicensed operation normally range from $7,500 to $10,000. (FCC, RAIN)

**

RADIO RULINGS: FCC PERMITS SAN JOSE STATION TO BUILD SAN FRANSCISCO TRANSMITTER

The San Franscisco Chronicle reports that thousands of people in and around San Francisco will be able to watch NBC television over the air again. This, courtesy of a Federal Communications Commission ruling on Thursday, August 12th, that will let KNTV build a new transmitter to cover the area.

According to the news story, the San Jose based station will be permitted to construct a new transmitter atop San Bruno Mountain which overlooks San Francisco. The station claims this site will reach 400,000 people who lost service when KNTV became the Bay Area's NBC affiliate in 2001. (FCC, San Franscisco Chronicle and other published news stories)

**

NAMES IN THE NEWS: ANOTHER OPERATION FROM IRAQ

Even as the military action in Iraq continues another ham radio stAtion has come on the air from that war torn region. This, word that Ryszard Nowakowski, SP8HKT has been licensed to operate as YI9KT.

Ryszard will be there for five months. He uses a 100 watt radio into a vertical antenna on all bands from 40 to 10 meters. He operates mostly on C-W but will come onto SSB if you make the request. (GB2RS)

**

NAMES IN THE NEWS: NEW QCWA OFFICERS ELECTED

Former FCC rules man John B. Johnston, W3BE, is the new President of

the
Quarter Century Wireless Association. Also elected are Vice-President
Bob Roske, NOUF: Secretary Alan Pickering, KJ9N and Treasurer Frank
Harris, WA4PAM

Elected to serve as QCWA Directors are Tom Atkins, VE3CDM: Harold Chase,
W1EES: Lew Gordon, K4VX: Jerrel Jones, W5TUU; Ray Minichello, W1BC: Len
Nathanson, W8RC: Blanche Randles, W4GXZ, and Ed Yoder W3YMB.

Both Gordon and Nathanson are former Directors of the ARRL. 2307 QCWA
members returned ballots in this years election. (QCWA)

**

EVENTS: 2004 QCWA NATIONAL CONVENTION IN OTTAWA

And speaking about the QCWA. word that the organization will hold its
2004 international convention in Canada. The dates are October 15th
through the 17th at the Lord Elgin Hotel in Ottawa.

This years gathering is hosted by the National Capital Chapter 70. More
information is on line at www.qcwa.org/2004convention.htm (QCWA)

**

BREAK 2

This is ham radio news for today's radio amateur. From the United
States of America, We are the Amateur Radio Newsline with links to the

relayed by the volunteer services of the following radio amateur:

(5 sec pause here)

**

ON THE NET: LINUX CONTINUES TO GROW

The use of the Linux operating system especially among experimenters including ham radio operators is quietly growing. One in five servers sold last year to handle Internet traffic and corporate networks ran on Linux.

Observers say that the economic downturn may be responsible for the Linux move. The Linux operating system was created as the people's software, free and open for everyone to use in an attempt to thwart the commercialization of all Internet technology. Amateur radio was among tgher first to truly embrace it and may ham radio applications are written for Linux based operation. (Published news reports)

**

HAM RADIO IN SPACE: NASA CELEBRATES ISS AT MARINA AIR FAIRE

Scott Avery, WA6LIE, reports over the AMSAT mailing list that NASA will have a booth set up at the Marina Air Faire in Marina, California on October 16th. Scott says that the plan is to make a live I-S-S voice contact and to also have a video of Q-S-O's made with the space station playing for passers by to see. Scott adds that any help in getting video files of school contacts with the I-S-S would be appreciated. For more information please contact him by e-mail to wa6lie@msn.com (WA6LIE)

**

WORLDBEAT: LIGHTHOUSES OF AUSTRALIA 2004 ANNUAL DINNER WEEKEND

Turning to news from around the world, word that this year's Lighthouses of Australia Dinner will be held in Launceston, Tasmania Saturday, October 2nd. The dinner will include a tour to the National Archives Office Exhibition on Australian Lighthouses titled "Beacons by the

Sea."

Also scheduled is a visit to the Low Head Light and the Pilot Station Maritime Museum also at Low Head the same weekend. (WIA News)

**

WORLDBEAT: RADIO CLUB GETS GRANT TO TEACH THE HOBBY

The Thornton-Cleveleys Amateur Radio Society in the United Kingdom has recently received a grant of close to 5,000 British Pounds. This, to help in the promotion of amateur radio. Over the past two and a half years the club has held 18 examination classes with 150 passing the U-K Foundation class ham radio license exam. (GB2RS)

**

WORLDBEAT: GB4WTA COMMEMORATING THE UK WIRELESS TELEGRAPHY ACT

GB2RS reports that Ted Moore, G7AIR, and members of the Eddystone Users Group will operate as GB4WTA on Sundays and some Saturdays through the 28th of August. The station commemorates the centenary of the United Kingdoms Wireless Telegraphy Act, which came into effect on the 15th of August 1904. GB4WTA will operate from Wireless Hill in the Rutland area. (GB2RS)

**

DX

In D-X word that K4QD will be QRV August 16 to 27 portable HH4 from. This, from the Northwest Christian Mission in Haiti. Activity will be on most H-F bands plus 6 meters, using CW and SSB as time permits. QSL to his home call. (K5SW via VHF Reflector)

And GB6LOP is a special events station that will take to the air to celebrate the 60th Anniversary of the Liberation of Paris during Word

War 2. The station will operate on all modes, starting August 25th and will be on for 4 weeks. Your QSL card will be required beforehand in order to receive the special QSL from this station. Please QSL via RSARS QSL Bureau. For further information contact G0SWY by e-mail to G0SWY@aol.com (G0SWY)

And also listen for HS7-B on from Thailand. This special event call sign has been issued to celebrate the Queen's 72nd birthday. The call sign will be in use during any SEA NET activities. QSL via operators' instructions. (RSGB)

**

THAT FINAL ITEM: THE BIG T-HUNT: HOW THE U.S. NAVY KEEPS TRACK OF EARTH ORBITING SATELLITES

The U.S. Navy has built an exotic radar system to track earth orbiting satellites, and the system has been in place for many years. Now, thanks to a couple of sleuths, details of the Navy's system have been posted on the web. Amateur Radio Newsline's Bruce Tennant, K6PZW, has the details:

--

The Navy's satellite tracking system appears to consist of multiple transmit and receive sites across the U.S., and one of the receive sites just happens to be located in San Diego County a few miles north of Brown Field. This, according to web-published coordinate data as reported in the CGC Communicator broadcast industry newsletter.

And if think UHF moon bounce antennas have gain, wait until you see the giant array built near Lake Kickapoo, Texas. This two mile long antenna transmits continuously on 216.98 Mhz with an unmodulated carrier and has a beamwidth of only 0.02 degrees in one plane. So powerful is the transmitted signal that when the moon passes through the beam, the return echo is said to be detectable on earth with only a dipole antenna attached to a receiver. Talk about the ultimate E-M-E.

For the Amateur Radio Newsline, Im Bruice Tennant, K6PZW, in Los Angeles.

--

If all this is fascinating and you want to learn more, take your web browser over to:
http://www.gate.net/~tomk/navspasur/navspasur5.html
and
http://www.jump.net/~crossley/NAVSPASUR/index.html (CGC)

**

NEWSCAST CLOSE

With thanks to Alan Labs, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's W-I-A News, that's all from the Amateur Radio Newsline(tm). Our e-mail address is newsline @arnewsline.org. More information is available at Amateur Radio Newsline's(tm) only official website located at www.arnewsline.org. You can also write to us or support us at Amateur Radio Newsline(tm), P.O. Box 660937, Arcadia, California 91066.

For now, with Bill Pasternak, WA6ITF, at the editors desk, I'm Henry Feinberg, K2SSQ, saying 73 and we thank you for listening." Amateur Radio Newsline(tm) is Copyright 2004. All rights reserved.

Jeff, realize that you're "preaching to the choir".

Mr. Gerritsen's actions and self-indulgent macho attitudes are typical of those that you will find within any hard-core prison population. Often it has been the underlying cause of their incarcerations by repeatedly leading them to perform criminal acts. Evidently, for these characters, criminal punishment is not a sufficient deterrent. Evidently, Gerritsen is a member of this set, because unlike normal individuals he appears not to learn from his experience suggesting some sort of a mental disorder -- perhaps his elevator does not go to the top floor!

Even scientists disagree on the root causes of such aberrant behavior, so I don't even want to go there...

Harry C.

Funny how you still mourn the death of your gay lover (even though you
caused his death by drinking on duty) Fred Eichorn, huh? What happened
to the fatassed bitch you shared your hovel with, Slater?

Hello Everyone,

First I would like to say thank you to those of you that read my original post and visited my new web site. I also appreciate all the feedback and comments that I received.

Based on that feedback, and since my web site is still new, I have decided to allow members to post a free photo ad. You can use this free ad to advertise your radio gear for sale, post a want ad, or even advertise your eBay auction item.

While you're checking out my new web site, please be sure to sign up for the free door prize drawing. The first door prize drawing will be held in October and one lucky registered member will win either a new ham or CB radio.

To learn more about how to get a free photo ad and to read the rules for the free door prize drawing, please visit http://www.onlinehamfest.com .

Please also tell a friend about my new web site or add a link to your web page. I could really use everyone's help in getting my new web site off to a good start. :)

Tnx es 73
Dave, Zed Zed

The Online Hamfest!(tm)

OK, some more stupid tricks.
In Jr. High school science fair some kid
brought in a one tube radio, powered by
a 1.5v A battery and a 90 volt B battery.
Radio wasn't working so some brainiac
said 'test the batteries'. How do you test
them? Kid said he tested transistor radio
batteries by touching them to his tounge,
to taste the sour a good battery caused!!!

Well he tried that with the B battery!

PS...It was VERY GOOD!!!!!

(just how far did he threw that battery

```
across the room, I forgot!)

Amateur Radio Newsline™ Report 1411 August 27, 2004

Amateur Radio Newsline report number 1411 with a release date of Friday, August 27th, 2004 to follow in 5-4-3-2-1.

The following is a Q-S-T. A ham radio operator looses his house and tower in a fire and an urban terrorist is the suspect. Also, interference to a ham could lead to a fine for an uncooperative neighbor and lots happening on the B-P-L front. Find out the details on Amateur Radio Newsline report number 1411 coming your way right now.

**

ALL POINTS BULLETIN: ARSONIST BURNS DOWN HAMS HOUSE

An arsonist with a grudge against radio has burned down the home of a Vancouver, Washington ham. Amateur Radio Newslines' Mark Abramowicz,
NT3V, has the details:

--

A $10,000 reward is posted and the Clark County Fire Marshal's office is tracking any and all leads it hopes help them capture someone who has been setting fire to communications towers in the Vancouver area since the beginning of the month.

Until recently, investigators say the targets have primarily been state government, telephone company and cellular telephone towers. But it was an Aug. 20 fire at the home of John Stein AB7F that now has alarmed the ham radio community in Vancouver.

The fire marshal's office says Stein's amateur radio tower was apparently targeted. It believes the fire was set at the base and spread upward along the feed line. Flames fell from the melting cables and spread to Stein's home.

Fortunately, authorities say, Stein was awake when the fire broke out about 11:30 p.m., got out, called 9-1-1 and tried to get a start on putting the fire with a garden hose. But the fire took off quickly and, unfortunately, the home sustained extensive damage in excess of $50,000.

The fire marshal's office says Stein told them he spotted somone running away from his home and he gave them a description.
Clark County Deputy Fire Marshal John Dunaway is leading the investigation into the communication tower fires.

At this point, the fire marshal's office will confirm basic details about the fires. But the fire marshal's office says there is certain information it cannot release at this time because it doesn't want to jeopardize the case it hopes to eventually bring against the arsonist.

Stein's home was not far from the fires at the other communications towers, the most spectacular of them on a more than 200-foot tall tower in Vancouver. That's shared by the Washington State Patrol and the Washington State Department of Transportation headquarters.

Officials say while the state patrol's communications in Clark County were disrupted by the fire, 9-1-1 communications were not affected. Damage in that fire was estimated at more than $100,000.

That blaze prompted the $10,000 reward offer from a foundation.
Ham operators in the Vancouver area are very concerned and fear anyone with a tower could become the next victim. They've been transmitting word about what's been happening via repeater, HF radio and the internet across the region. They're urging hams with towers to be especially vigilant and take precautions to protect their feedlines, but more importantly their homes and their lives.

For the Amateur Radio Newsline, I'm Mark Abramowicz, NT3V, in Philadelphia.

--

There is general agreement that this anti radio fire bug has to be stopped before someone to loose their life in one of his blazes. If any one has information regarding these fires or the person setting them please call the Crime Information Tip Line at 877 - 274 - 6311 or the Clark County Washington Fire Marshal's Office at area code 360 - 397 - 2186 and ask for extension 3396. You may remain anonymous on either line. (ARNewsline ™, CGC, others)

**

ENFORCEMENT: FCC WARNS NEIGHBOR OF HAM OVER INTERFERENCE

A neighbor of a ham radio operator who refuses to clean up interference he is causing could now face a stiff fine. The FCC'as
Daryl Duckworth, NN0W, says that the agency is giving the neighbor one last chance to comply:

--

Duckworth: "A follow-up warning letter went to a resident in Friendwood, Texas, concerning interference to William Cooper, W5ZAF, from a battery charger. The amateur had supplied ferrite beads earlier to the resident which did solve the problem. Evidently, the resident changed his mind and tossed the ferrites back over the fence."

--

The FCC says that if the interference is not corrected by September 15th, it will have its Field Office investigate the matter and possibly issue the uncooperative neighbor a hefty fine. It also suggested that he consult an attorney regarding the FCC rules that control radiation from unlicensed devices like the battery charger that's causing the problem to the ham next door. (FCC, RAIN)

**

THE BPL FIGHT: ARRL ASKS FCC TO CLOSE DOWN AZ. BPL TEST

Some important developments on the B-P-L front. First to Arizona where the ARRL is calling on the FCC to immediately shut down a Broadband Over Powerline field trial in the Cottonwood. This, because it's causing severe interference to Amateur Radio communication in the area.

The ARRL Letter says that Electric Broadband LLC and utility A-P-S have been operating the B-P-L experiment at two sites since June under a Special Temporary Authorization the FCC granted Electric

Broadband in March. Michael Kinney, KU7W, filed the first Amateur Radio complaint in June. It cited testing by the Verde Valley Amateur Radio Association in the 1.8-30 MHz range to show that B-P-L interference made attempts at ham radio communication useless. The interference on typical Amateur Radio equipment shows received undesired signal levels in excess of 60 dB over S9.

According to the ARRL, both the utility and Electric Broadband were contacted, and no response was received. The ARRL says that both companies are aware that the B-P-L field trial has been causing harmful interference and neither has taken any steps to either resolve it or terminate the test. (ARRL)

**

THE BPL FIGHT: BAD NEWS FROM DOWN UNDER

Meantime, Broadband Over Powerline and its introduction in Australia has that nations hams on the alert. This, because little has been known about what has been occurring behind the scenes as power companies prepare to adopt the B-P-L technology and the Australian Communications Agency considers rules to govern it. Now, WIA Newsman Jim Linton, V-K-3-P-C has uncovered an almost terrifying development. One that could mean the end of H-F operations down-under for many V-K hams.

--

The future introduction of Broadband Powerline Communications (BPL) in Australia could be on the condition that "less significant" HF radio users such as radio amateurs and four wheel driver clubs would not be protected from any interference it causes.

The Australian power industry has a real concern about the added expense required to address interference that could affect amateur radio stations and other recreational radio users. Its arguments include that to remove amateur radio frequencies from a BPL system will add cost and reduce the capacity and potential data rate. The power industry is requesting that the Australian Communications Authority (ACA) outweigh the concerns of recreational or "less significant" HF radio users with the higher community benefit of providing greater access to broadband-enabling technology.

The ACA, in response to the power industry concerns, is now examining the legal possibility of allowing BPL networks to cause substantial interference to "less significant" radio services, while other radio services would continue to be entitled to interference protection. Presumably if this becomes reality the Amateur Service could lose its protection against harmful powerline interference too. After all, were are in the eyes of some just a "less significant" radio service.

This has been Jim Linton VK3PC for WIA National News.

--

If this does happen it could mean a lot fewer V-K callsigns will be heard on the Hiugh Frequency and low VHF bands. (WIA News)

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the repeaters of the Rocky Mountain Radio League serving Denver and Bloomfield, Colorado.

(5 sec pause here)

**

RESTRUCTURING: ARRL PROPOSES BANDWIDTH DEFINED HAM SERVICE

The ARRL has released a synopsis of its petition to the FCC aimed at restructuring the Amateur service along bandwidth defined lines. While what has been made public is highly abreviated, a drafted, the ARRL's bandwidth petition would preserve double-sideband AM and would stop short of opening the phone bands to digital and other modes of the same bandwidth.

The ARRL's petition also proposes to limit bandwidth in the CW subbands to 200 Hz, which also will accommodate data modes such as PSK31. It also suggests to limit bandwidth in the existing "RTTY/data subbands" to either 500 Hz or 3 kHz, with phone emissions specifically prohibited in certain subbands where 3 kHz would be permitted.

Obviously this will be an ongoing story. More on this next week as reaction comers in. (ARRL)

**

HAM RADIO IN SPACE: HURRICANE CHARLEY WRECKS AMSAT LAB

Hurricane Charlie has also taken its toll on the Amateur Radio space program. This, with word that the storm destroyed the building housing the lab used to assemble the latest series of ham radio satellites.

Hurricane Charlie hit Orlando, Florida at about 8 p m Eastern on Friday, August 13th packing sustained winds estimated at close to 100 miles per hour. One of the places sustaining damage was Orlando Executive Airport. This was home of the AMSAT Laboratory. The place where ham radio satellites have been assembled and tested prior to launch.

Rick Hambly, W2GPS, reports that AMSAT members in the area survived with relatively minor damage but the building that houses that AMSAT Lab suffered severe structural damage from Charley's onslaught.
It
has now been condemned and will have to be torn down.

W2GPS says that the equipment and parts inventory at the lab are in good shape but AMSAT was given less than two weeks to move out and find temporary storage for its equipment. The Amateur Radio space agency also must begin a search for a new building to support development of the Eagle ham radio satellite and future projects.

Complicating matters is that AMSAT's insurance does not cover the costs of temporary storage or of moving to a new facility. So, they are asking the Amateur Radio community to keep ham radio space projects alive by sending a donation to AMSAT's Hurricane Fund. Hambly says that the money collected will be used to get the lab back in operation as soon as possible.

AMSAT North America is a federally charted 501(c)(3)not for profit organization. Any donation should be tax deductible in the United States. Information on the fund and how to donate is in cyberspace at www.amsat.org. (AMSAT-NA, W2GPS, W5DID)

**

RESCUE RADIO: RADIO STATIONS GET PRAISE IN CHARLEY AFTERMATH

Broadcasters in Florida have been getting involved as the clean-up following Hurricane Charley. One has taken on being the voice of the storm ravaged area.

According to the CGC Communicator, FM radio station Seaview-104.9 in Punta Gorda, Florida and four of its sister stations are all owned by Clear Channel Communications. Seaview-104.9's studios were damaged and the station was knocked off the air by Hurricane Charley, but service was restored within hours. According to a report in the St. Petersburg Times, once the storm had passed, General Manager Mike Moody returned to the building housing his station. The roof was shredded and the ceiling collapsed. But one studio, no bigger than a walk-in closet, was in working order.

Moody said that there was no power but using a generator he got the studio on the air. He also found a phone outlet reserved for a FAX machine operating so he plugged in a phone, put the receiver to the microphone and then let callers unravel their tales of storm survival.

The studio is the only one based in Charlotte County. Because of this it has become a lifeline for residents searching for information to help them cope with the storm's aftermath and listeners like Ron Hall, KP2N, have rallied around the station in support of its vital post storm activities. (CGC)

**

RESCUE RADIO: UK GROUP ACTIVATES FOR FLOODS

Meantime, over in the U-K, a ham radio emergency communications unit was activated. This, after severe rains caused flooding near the town of Boscastle. Jeramy Boot, G4NJH, is in Nottingham with more:

--

Cornwall Raynet Groups were put on standby by their Emergency Planning Unit on the evening of Monday, 16th August, following communications difficulties resulting from the massive flooding at Boscastle. Eleven volunteers were available to proceed to the emergency, but were stood down later as the communications difficulties had been resolved.

Jeramy Boot, G4NJH

--

For those not aware, RASYNET is the U-K equivalent of ARES and RACES here in the U-S-A. (GB2RS)

**

HAM RADIO ON THE NET: MORE CHANGES AT QRZ.COM

More changes have come to the QRZ.com super site. This, as its owner Fred Lloyd, AA7BQ, announces some policy changes regarding the callsigns that are listed in the QRZ Callsign database.

--

According to QRZ's Lloyd, the site will no longer accept callsign designators, prefixed or suffixed, as independent callsigns. This would include reciprocal calls such G 3 slash K6PZW -- a call I might be assigned if I were visiting England.

Lloyd says that these listings were problematic for both the QRZ website and the QRZ CD ROM, and they were of questionable value to begin with. As of the latest software update, the server will no longer accept or record such entries. The logic is that anybody wanting to contact the callsign holder could just as easily look them up by their primary callsign.

Also gone will be non ham call signs such as those self issued by individual SWL's, Weather watchers, and others. Lloyd says that
Q-R-
Zed will continue to accept SWL listings as long as they are issued by a formal body, and so long as they have an alphanumeric format. But Lloyd says that an SWL callsign cannot be a primary login account name to a website that manages amateur radio callsigns.

The bottom line: Non-amateur callsigns will continue to be excluded from the QRZ CD ROM and will take last priority with server management resource. In other words, they will be listed on a time and space available basis, only.

For the Amateur Radio Newsline, I'm Bruce Tennant, K6PZW, reporting.

--

These changes are in addition to the posting policy changes that Lloyd announced two weeks ago. (QRZ.com)

**

RADIO LAW: SENATE WARNING ON CABLE RATES

The Senate says that it will consider new regulations for cable television unless the industry addresses soaring prices and allows consumers more channel choices. Members of the Senate Commerce Committee said pressure from angry constituents is leading them to look at ways to hold down cable rates and let subscribers choose individual channels rather than packages set by operators.

Since Congress deregulated the industry in 1996, cable rates have increased by 53 percent while inflation has risen 19 percent. Cable operators said the jump reflected higher programming costs, more channels and system improvements such as rewiring to provide digital TV. (Published reports)

**

RADIO LAW: BETTER CELLULAR SERVICE

The government says wireless companies are doing a better job of switching customers who want to keep their cell phone number. In the first month after the change took effect, the Federal Communications Commission received 24-hundred complaints. Most were from people who said the transfers were taking too long. In the past month, the number of complaints has fallen to 400. Customers have had the option of keeping their phone numbers when they switch to a new carrier since November. (Science OnLine)

**

EMERGING TECHNOLOGY: PERSONALIZED PHONE MUSIC SERVICE FROM SONY

Meantime Sony Corporation has announced what it called the first personalized radio service for mobile phones. Under the still-unnamed music streaming service, subscribers would not own any of the songs but could create a customized channel to listen to the music they want, storing favorite tunes in personal playlists. Users would also be able to listen to music from a collection of predefined channels. A "smart personalization" feature could also keep track of the subscriber's music preferences and make song suggestions. (Sony)

**

THE SOCIAL CIRCUIT: TENNESSEE IN AUGUST

Turning to the ham radio social calendar, word that Tennessee's Short Mountain Repeater Club will be sponsoring the Cedars of Lebanon Hamfest on August 28th. This, at the Gladville Community Center in the town of Gladville Look for vendors, a large tail gate sales area and lots more. For more information e-mail keharris@netc.com or take your web browser to www.qsl.net/smrc (E-mail)

**

THE SOCIAL SCENE: LIGHTHOUSES OF AUSTRALIA 2004 ANNUAL DINNER WEEKEND

And if you want to travel a bit, this year's Lighthouses of Australia Dinner will be held in Launceston, Tasmania on Saturday, October 2d. The event will include a trip to the National Archives Office Touring Exhibition on Australian Lighthouses known as "Beacons by the Sea." It will also include visits to the Low Head Light and the Pilot Station Maritime Museum also at Low Head the same weekend. (GB2RS)

**

THE SOCIAL CIRCUIT: GERMAN VHF CONVENTION HAS NEW DATE

And from Europe word that Germany's Weinheim VHF Convention, which had originally been scheduled for August 28th and 29th will now take place on 11th and 12th of September. The new venue is Bensheim which is 10 kilometers north of Weinheim. Full details are on the web at www.ukwtagung.de (DARC)

**

BREAK 2

This is ham radio news for today's radio amateur. From the United States of America, We are the Amateur Radio Newsline with links to the world from our only official website at www.arnewsline.org and being relayed by the volunteer services of the following radio amateur:

(5 sec pause here)

**

WORLDBEAT: CB SPECTRUM SHARING IN THE UK

There may soon be some new sounds on 27 MHz C-B in the United Kingdom, and they won't be saying 10-4 Good Buddy. In fact they may be very formal sounding. This, as British telecommunications regulator Ofcom proposes to allow local religious and community organizations to operate one-way low power broadcast stations within the U-K Citizens' Band allocation. Our producer, Bill Pasternak, WA6ITF, has more:

--

No. Its not a joke. And Great Britain's Office of Communications -- Ofcom -- says that this is how the new shared C-B service will work.

At first a small number of organizations will be licensed to transmit religious services in a limited number of pilot areas. These would be called Community Audio Distribution Systems or C-A-D-S. Their specific purpose will be to allow house-bound religious congregation members -- people unable to travel to a house of worship but who wish to hear local religious community services -- the ability to do so.

If proven effective, Community Audio Distribution Systems would be expanded as a short-range and inexpensive wireless public address systems. The U-K radio regulator says evidence of demand for such arrangements has arisen primarily from within religious communities and this is where Ofcom expects the majority of use to be. But its not making this a religious-only radio service. In fact it is encouraging other community groups could also use the system for other similar purposes.

To test these plans, Ofcom is proposing a closely monitored year-long pilot program in the areas where interest has been most widespread and sustained. This includes West Yorkshire in England and all of Northern Ireland. In those regions C-A-D-S users will share spectrum with the Citizens' Band users in a way that Ofcom says will provide the flexibility required to transmit religious and community service material while protecting other spectrum users from harmful interference. At least it will try its best to do so.

For the Amateur Radio Newsline, I'm Bill Pasternak, WA6ITF, reporting.

--

Can something similar happen here in the U-S-A. Not likely. At least not very soon. C-B is still to crowded, unruly and unstructured a band to effectively share. But it is expected that other administrations world-wide will be watching this United Kingdom C-B sharing experiment with an eye to introducing similar services in their nations as well. (RSGB)

**

WORLDBEAT: BIG VHF TECH SYMPOSIUM DOWN-UNDER

The Wireless Institute of Australia's Central Region is holding a Technical Symposium Saturday October 2nd. Rex Moncur VK7MO will discuss Digital enhancement of VHF signals, Doug Mc Arthur VK3UM EME Techniques, Joe Kasser VK5WU Computers for Amateur Radio and David Giles VK5DG will explain that Amateur Satellites are really only high tech repeaters on orbit. The venue is the Modbury Heights School with talk-in on 148.850 MHz. (WIA News)

**

HAM RADIO IN SPACE: INDIA'S HAMSAT READIED FOR LAUNCH

A Dutch student is helping India put its first Amateur Radio satellite in orbit. Willian Lijenaar, who has graduated as an electronics engineer, has provided a transponder to the satellite.

According to the W-I-A News, the Indian project is called HamSat and is scheduled for launch in four or five months. Reportedly, the coordinator of HamSat had asked the young Dutch engineer to design and build the transponder. Along with Lijenaar's unit an Indian built transponder will be part of new bird as well. (WIA News)

**

RADIO SCIENCE: NASA TO SAVE HUBBLE

NASA has decided to try to save the orbiting Hubble Space Telescope. Possibly by sending a Canadian made robot to fix it.

Nasa Administrator Sean O'Keefe told researchers at the agency's Goddard Space Flight Center in Maryland about the plan. He also has instructed engineers to begin work to put the robotic mission into orbit by 2007. (NASA)

**

DXCC: SOMALIA NOW ACREDITED

Some good news for D-Xers. Effective immediately, the ARRL DXCC Branch will accept QSL cards for operations taking place in Somalia using the 6O / T5 prefix and suffix. This includes the Somaliland which is north-western Somalia and Puntland in north-eastern Somalia. These are autonomous areas but will be accepted along with the southern and central areas of that nation.

The DXCC will also accredit operations possessing written permission from any recognized authority that is acknowledged to be in control of a particular region of Somalia. All cards will count for the Somali Democratic Republic. And says the DXCC, QSL's for past operations will be accepted where proper documentation has been submitted.

Of coarse this is subject to change based on future developments in Somalia. We quill have more D-X news a bit later on. (ARRL, GB2RS)

**

DX

In D-X, word that Kris Partridge, G8AUU, is working in Baghdad and has received the callsign YI9AU. Kris is reported to be active on the High Frequency bands using 100 watts to a long wire but hopes to improve his antennas soon. He is also hoping to become active on Echolink and says that he be in Iraq until early or mid-September.

And G0JMU is again active from Malawi as 7Q7HB. Reports say that he will be there until at least the 22nd of September.

Also, news that 5B4AFM will operate as J42004A from Skopelos and Athens through the 1st September. The island of Skopelos counts as EU-072 for the RSGB Islands on the Air award program.

Lastly listen for the Cook Islands to be on 6 meters with a better signal in coming weeks. This as KC5YKX reports over the VHF Reflector that he has shipped a 5 element beam there for ZK1CG to use. ZK1CG should be on the Magic Band as soon as the antenna arrives. QSL all of these operators in these stories as directed on the air.

(All aboveDX from various DX sources)

**

THAT FINAL ITEM: ECHO - THE TONE ACCESS HAM RADIO SATELLITE

And finally this week a rhetorical question. Why use continuous tone coded squelch access to talk through a ham radio satellite? AMSAT says that there are several very good reasons and Amateur Radio

Newsline's Norm Seeley, KI7UP, has them in this report:

--

Continuous tone coded squelch is better known in ham radio circles under its Motorola trade name of P-L or Private Line. And AMSAT says that there are several good reasons to use it on the new Echo ham radio satellite.

First, and simply, is on orbit power management. The ability to minimize the amount of power used by the satellite.

Recent data collection shows that on average, Echo's tone access FM repeater transponder is on for less than 40% of an orbit. There are orbits where that number is as high as 65%, but the average is below 40%. That means the satellite is conserving over 60% of the power that would have been consumed by the transmitter if it were being keyed up by every random signal passing through its receiver. Since you cannot easily change rechargeable batteries on a satellite like you can on a terrestrial H-T, power management is crucial to the long term stability of Echo or any man made satellite.

The second reason kind of tag's onto the first. Its the idea of minimizing the three letters dreaded by hams world wide: Q-R-M.

In the tone access mode Echo does not have to listen to other traffic on the Amateur bands or any other signal not intended for the satellite to relay. While the satellite still has to compete with these R-F sources to capture the receiver, they are not retransmitted downlink. This means you do not have to listen to taxi cabs being dispatched in some third-world nations where the V-H-F Amateur bands have more business going on than ham radio contacts being made. A problem that the world wide Intruder Watch program has been fighting for years.

Yet another reason for tone access on Echo. By closing the audio path when no access tone is present the ground based user hears a short unmodulated carrier for the duration of the squelch tail. This can be used as a good measure of how well you are actually hearing the satellite.

Without tone access filtering, uplink band noise is heard. And, any ham who has heard a carrier access repeater where the squelch is open knows what that sounds like. Amplified noise that is sometimes difficult to differentiate from the actual band noise. In the case of a ham radio satellite it means not knowing if you are hearing the bird at all.

For the Amateur Radio Newsline, I'm Norm Seeley, KI7UP, in Scottsdale, Arizona.

--

After Echo's launch there was talk on some terrestrial repeaters that
AMSAT had put a private P-L repeater in space. This is far from the case. Without tone access, the lifespan of Echo would be significantly reduced and fewer hams would have their chance to make contacts through it. (ANS)

**

NEWSCAST CLOSE

With thanks to Alan Labs, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's W-I-A News, that's all from the Amateur Radio Newsline(tm). good afternoon to you all in the news group I have a rigblaster pro for
sale,I was using it with my yaesu mk5 field,but have sold it now so the
rigblaster is now redundant,it comes with all the leads books box,only
3months old,the price I am after is �135. if any one is looking for one
please leave a message or email me at    andy@kingslynnweather.co.uk.thanks
for looking at this posting

Hi Paul,

Here's some to remember next time you are raising an antenna near power lines:

Guy on PCP grabs 16,000 volts and lives:

  http://members.tripod.com/~StormTrooper_2/index2.htm
```

High Voltage Sparks and Arcs - cursor down to "Crane Tangles with a 46 kV Feeder..."

http://205.243.100.155/frames/longarc.htm

Best

Mike

Wow. Spectacular videos. I cranked up the sound for maximum effect on
the 500KV one, and after several plays, one of my destop speakers walked
off the desk and fell on the floor.

This comment reminded me of a High Current Horror Story related to me by an older friend. In his youth he repaired radios, hi-fi systems, and the like. One well-heeled customer had large, expensive speakers at the room corners, with the hi-fi in the middle. He'd put the speaker wiring in the walls. For connectors, he'd used ordinary mains AC power receptacles, with matching cord and plug on each speaker.

When the repair was finished, my friend plugged the speaker back into the outlet. He knew exactly what had happened the moment he plugged it in when he heard a monstrous, deafening hum -- but even then it was too late, the speaker was cooked. Let's see, 120^2 / 8(*) = . . . now, that's LOUD!

Roy Lewallen, W7EL

(*) and I suspect that the speaker impedance was somewhat lower yet at 60 Hz.

And you reminded me of something too. Not really a problem, but could have been.

When I was working on mainframe computers in the 70's we installed a new machine in Europe. The power for the computer was supplied by a big motor generator with an output of 3-phase 208 V 400 Hz (or was it CPS back then?) power to the computer. I learned from the customer that they discovered that a wiring error had routed the motor generator power to the wall sockets in the computer room.

I told the customer that it was very good they had found this problem before people used the sockets. If the cleaning lady had come in and plugged a vacuum cleaner into the 400 Hz power, it would have probably sucked all the air out of the room. :-)

You almost had me hooked on your site (which has a nice look and is well constructed) until I tried to browse the listing. After the "tease" of being allowed to see the 1st page of the first (of two) Yaesu items and then finding that I have to register, login, etc, just to continue browsing I just clicked over to QTH . Anybody with common sense can figure out that the casual window(s) (pun intended) shopper doesn't want to have to login just to browse. Even ebay figured that one out years ago!

Our newer systems back in 1985 used dual MG setup 400 Hz and 50-60 VAC

anyway, one of the tape drive units had failed, IBM arrived and was checking power connections in the power supply (they call it a power tub).
Other IBM guy (new young pup) kept leaning on the control unit while the old timer IBM guy was trying to probe the voltages at the breakers.
Almost gave him a large shock before we told him to get off our control unit.

Same young pup wants to get under the floor to unplug the large power connector russelstoll 30 amp 3 phase, old timer grabs him by his belt from behind, and saved his life !

IBM guy takes the rubber cord and then gently glances the RS connector to the floor supports (all metal and gounnded with copper cables) large sparks when he did this !

Young ibm pup almost pee in his pants.

Turns out somebody on work crew did not wire the ground cables properly so the floor was HOT HOT HOT ! Good thing it was carpeted flooring in the computer center.

Listen on the image. Yea, I know the sensitivity is bad there. Or build a simple "Offset Attenuator" seen on RDF sites.

Besides (in the US at least) analog cellular is rapidly going away.

I meant to imply that there won't be anything to listen to when it does, so it makes no diff if you can tune there or not...here in US anyway.

Perhaps turning it into an F7 (snip snip] will allow tuning there?? Anybody know if the F7 version tunes there?

I would like to start a new thread on this topic. Please tell me what is
the next thing that I should change, or do differently, to my new web site?
Tell me both what you like and what you don't like. My new web site is
designed for amateur radio use but why people are not using it, is what I
would like to know. My new web site is locate at
http://www.onlinehamfest.com

Please help.

Well there about 35 such sites on the web.
And e-bay gets thousands maybe hundreds of thousands of sellers buyers as
well as the ARRL classifieds.
Several other biggies.

So pretty husky competition

A method to draw hams to your site is to offer free information.
See some of the mega sites listed in QST last month for how the biggies do
it.

```

Well there about 35 such sites on the web.

And e-bay gets thousands maybe hundreds of thousands of sellers buyers as
well as the ARRL classifieds.
Several other biggies.

So pretty husky competition

A method to draw hams to your site is to offer free information.
See some of the mega sites listed in QST last month for how the biggies do
it.

That seems to be only an oppinnion about this type of web site. Please tell me what you liked and what you didn't like about the web site.

With all the mega-sites in mind, what changes would you make to any of these web sites to make them better?

I am giving away a new ham radio every month, I have upgraded the privileges for unregistered users, I am giving away free ads, offering free web space for your photos, permitting you to link directly to your eBay auctions and web sites, allow commercial vendors to place a free ad, and allowing many other things that most of the mega-sites do not!

Now, please tell me what else would you do differently?

It looks like you are doing all the right things. Folks want free manuals -- there are some web sites for this. Folks want VSWR explained. Lots of others - like software listings will draw hams in, likewise homebrew, list of ham stores etc
A friend started a mega site 4 years ago -- took 2 years to catch on.

Keep trying

Put your site on the search engines

Write the appropriate meta tags in the HTML so the search engines can find you.

Okay, based on several suggestions, I have done a major edit to the main index.html page.

What I have learned from the group so far is that many visitors were just unaware of the many difference and features of my new web site. Many of these features have now been listed on the front page. Check it out at http://www.onlinehamfest.com/index.html

Thanks for the help and keep those ideas and suggestions coming! :)

Dave, Zed Zed

Amateur Radio Newsline™ Report 1412   September 3, 2004

The following is a message from the Amateur Radio Newsline Support Fund. Here's the funds administrator, Andy Jarema, N6TCQ.

--

Well, here I am again, so theres obviously another financial crisis that Amateur Radio Newsline is facing. And this time its a real doozie. Let me explain it to you.

During the summer many of you are away and donations dwindle to a mere trickle. At the same time, some of our biggest yearly expenses occur during July and August. This includes the Young Ham of the Year Award presentation that we host every year in Huntsville, Alabama. While we had planned ahead, we did not know exactly how much we would need and we were caught short. The price of airfares was up as was the cost of hosting the mini banquet for our recipient, her family and friends.

Added to that were higher than anticipated telephone costs to cover the breaking news stories we brought you over the summer. And right now that leaves us with less than $50 in the bank and several hundred dollars in outstanding bills that must be paid right now to keep Amateur Radio Newsline coming your way.

As we have said before, Amateur Radio Newsline is a federally charted 501(C)(3) and California state not-for-profit corporation. For most United States residents it means that your donation is tax deductible.

So please help keep the news on your local net, on your repeater and on your computer by making a donation to the Amateur Radio Newsline Support Fund. Its address is Post Office Box 660937, Arcadia, California. The zipcode is 91066.

Again that's the Amateur Radio Newsline Support Fund at Post
Office
Box 660937, Arcadia, California, 91066.

On behalf of the entire all volunteer world-wide Amateur Radio Newsline team, I thank you for listening to this appeal and for your ongoing support that keeps the news of Amateur Radio coming your way.

I'm Andy Jarema, N6TCQ. Now Amateur Radio Newsline report 1412.

--

Thanks Andy. Now Amateur Radio Newsline report number 1412 with a release date of Friday, September 3rd, 2004 to follow in 5-4-3-2-1.

The following is a Q-S-T. The ARRL bandwidth based restructuring proposal causes controversy and maybe some reconsideration. Find out more on Amateur Radio Newsline report number 1412 coming your way right now.

(Billboard Cart Here)

**

RESTRUCTURING: REACTING TO THE ARRL BANDWIDTH PROPOSAL

An ARRL proposal to restructure Amateur Radio along bandwidth lines has caused a lot of discussion in the nations ham community. And it may cause the League to rethink its position. Amateur Radio Newsline's Mark Abramowicz, NT3V, is in Philadelphia, and has the rest of the story:

--

Shortly after the ARRL began circulating the proposal and posted it on its website, the e-mails, phone calls, HF, VHF, and digital-mode traffic took off.

And now, Amateur Radio Newsline has learned the bandwidth proposal may be tabled for more study when the ARRL's executive committee meets next month.

That confirmation comes from W6OBB in Nevada. If the call sign isn't familiar, the name behind it might be. He's Art Bell, host of the weekend edition of "Coast to Coast AM" heard on more than 500 commercial radio stations across the nation.

Bell, who joined the fight against Broadband Over Powerlines several months ago, and featured the subject on his radio program, expressed concern about what he called a Draconian proposal that would over-regulate the ham bands. Bell tells me he relayed that concern in a phone call to ARRL President Jim Haynie W5JBP.

Bell characterizes the discussion as cordial and at the end, he says Haynie related he was re-evaluating the proposal based on many comments he had received.

"He indicated to me and told me I could pass on to you that they're looking into pulling this whole thing back and taking a harder look at it," Bell says.

While Bell says he believes the ARRL had good intentions with the proposal, it may have gone too far.

"What began as an examination by the League of how we could possibly encourage the digital mode, it went a little too far and began to over-regulate," Bell says. "I'd kind of like to see it go the other way and I'd like to see our bands freed up."

Haynie says he's gotten a lot of feedback on the proposal. He says it came from the League's desire to promote - not restrict - innovation and experimentation. He says it was also a response the Federal Communications Commission's desire to see more innovation from the ham community.

"I think we rose to the challenge," Haynie says. "We have demonstrated Software Defined Radio that just knocked their socks off, in my view.

"We have come up with some other stuff - Joe Taylor and some of his things for moon bounce. And I think the Amateur Radio community needed a wake-up call is what they needed and I think that's what we've gotten and were given."

Haynie says it's clear the digital modes like RTTY and PSK 31 need attention.

"Where do we want to go to the future?" Haynie asks. "And, as I mentioned a couple of years ago, I took my model 28ASR and took it to the scrap man. But that's the standard that's used today is 850Hz shift at 45 baud.

"Well, we don't do too much of that. I'm not saying there's not RTTY enthusiasts out there, there are and I appreciate that and I know that and I want to protect their rights to do those things."

Art Bell says he and others don't object to digital innovation. But he doesn't think the proposal hits the mark.

"There are many with differing interests who are not too pleased with the proposal and, on the face of it, it simply does not make sense," Bell says. "I agree that we should encourage the digital modes and development, but we shouldn't try to push something into place that is not techincally ready to happen yet."

Restricting bandwidth, Bell says, won't promote innovation.

"Why do we have to cut and slice and dice and regulate," Bell says. Why not just let anybody virtually go anywhere and let all of us just live together with some gentlemen's agreements which we have now and which work very, very well on most bands?

"So with that in mind, look at the Canadians. The Canadians have a 6khz limit and they can go anywhere on the band they want from the bottom to the top. And I don't see why that would not apply and work well in America."

Haynie says he wants to hear more from hams and he's encouraging all of us to get into the FCC's Part 97 rules and share input on the proposal at the ARRL's website, that's ARRL-dot-org.

"Look at the rule book and see what's there now, "Haynie says. "And, is there something that could be changed that would allow a new technology to be developed, then that's what we want to know."

For the Amateur Radio Newsline, I'm Mark Abramowicz, NT3V, in Philadelphia.

--

More on the ARRL proposal and reaction to it in upcoming Amateur Radio Newsline reports. (ARNewsline(tm))

**

RESTRUCTURING: DROPPING CW TESTING IN CANADA

Meantime, to the north, another form of restructuring proposal is being considered by hams in Canada. This as telecommunications regulator Industry Canada publishes a Gazette Notice called "Recommendations from Radio Amateurs of Canada to Industry Canada Concerning Morse Code and Related Matters".

The Radio Amateurs of Canada proposal deals with the WRC-2003 decisions concerning Morse as a compulsory qualification for High Frequency operation in the Amateur Service. Radio Amateurs of Canada has recommended that Industry Canada delete the mandatory aspect of the requirement for Morse testing but leave it as a voluntary qualification. This, because knowledge of code may be required for reciprocal operation in those countries retaining a Morse requirement.

The notice was published on Saturday, August 28th and gives Canadian radio amateurs sixty days in which to respond. Radio Amateurs of Canada recommends that the nations ham community endorse this proposal. (RAC)

**

ENFORCEMENT: 10 METER INTRUDER WARNED

Here in the United States a commercial business has been warned to stay of the 10 meter ham band. The FCC's Daryl Duckworth, N-N-Zero-W, explains:

--

Duckworth:"Dandy Service Corporation of Warrendale, Pennsylvania, was issued a warning notice fot unlicensed radio operations on 28.085 Mhz. Two of their vehicles were the source of transmissions on August 5th of this year in Michigan on Interstate 94 at mile-marker 262."

--

Dandy Service was told to advise its drivers that operation of radio transmitting equipment without a license is a violation of the Communications Act of 1934. That it could subject the operator to fine or imprisonment, as well as an seizure of any non-certified radio transmitting equipment. Monetary forfeitures normally range from $7,500 to $10,000. (FCC, RAIN)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the N7VGS repeater serving Star Valley Wyoming.

(5 sec pause here)

**

THE BPL FIGHT: IT MAY BE COMING TO SO. CAL.

A heads up warning to hams living in the California counties of Los Angeles, San Diego and Riverside. According to ARRL officials in the Southwestern Division, Broadband over Powerline may be coming your way.

Writing in the latest issue of the division electronic newsletter, Director Art Goddard, W-6-X-D, and Vice Director Tuck Miller, N-ed-6-T, say that power companies in these areas may be considering BPL as a new business venture. The two officials add that the regions Amateur community needs to work together to see if they can head off these B-P-L flirtations before they become entrenched on the ham radio bands.

The report goes on to say that local ARRL Section Managers are already on top of the situation. The S-M's are reportedly forming Local Action Teams to work on all levels in handling the B-P-L threat to the area. (ARRL Southweestern Divisioon Communicator)

**

OPERATIONAL NEWS: TO PL OR NOT TO PL - THATS THE SERA QUESTION

Repeaters in eight states and the hams that operate through them may soon face mandatory use of continuous tone coded squelch. Then again, they may not. Amateur Radio Newslines Gary Pearce, KN4AQ, is in Raleigh, North Carolina, trying to sort it all out:

--

SERA, the SouthEastern Repeater Association, ignitied a furious debate when its Board of Directors voted to require the use of tone as a condition for frequency coordination for all repeaters in its territory. SERA is the frequency coordinating group for eight southeastern states: Georgia, Kentucky, Mississippi, North and South Carolina,| Tennessee, and parts of Virginia and West Virginia.

The SERA Board voted at its June meeting that some form of tone access will be a condition of coordination for all new repeaters effective immediately. Existing repeaters will need to adopt tone within two years, by July 2006. The board was acting on a motion by Steve Grantham AA5SG, the Director from Mississippi. The goal of the policy was to reduce the number of complaints that SERA coordinators receive from repeater owners whose carrier access repeaters are keyed up by users of a co-channel neighbor.

In discussion at the meeting, the new policy was softened some when coordinators asked if this meant that repeaters would be automatically decoordinated if they decided not to use tone. The answer, according to an article in SERA's magazine the Repeater Journal, was "no, but…" SERA would not entertain an interference complaint from repeater owners who remained carrier access.

The debate began in earnest when the August issue of the Repeater Journal began arriving and the ARRL published a story about it on their web site. Repeater owners argued the merits of tone itself, along with complaints that SERA didn't poll its members, and non-member repeaters, before making the decision.

The decision may not be final, according to SERA President Roger Gregory W4WRG:

--

Gregory: I've received, and we have received a lot of comments pro and con about this policy. And all I can say right now is that we're taking a second look at it and it's not really written in stone at this time as to what kind of decision we're going to make one way or the other."

--

SERA's next Board meeting takes place in January, but the group can reach an earlier decision at any time through an e-mail ballot.

Reporting for Newsline, this is Gary Pearce KN4AQ in Raleigh, North Carolina.

--

So will the hams in SERA coordinated states have to use tone access on every repeater? Right now, the answer seems up in the air.
(KN4AQ, ARNewsline(tm))

**

HAM RADIO IN SPACE: ISS GOES CROSS-BAND REPEAT

Speaking of repeaters. there's a new cross-band F-M system in space
and its home is on the International Space Station. This, as the ARISS program announces that the amateur radio equipment aboard the orbiting outpost is now on the air in repeater mode.

The downlink frequency remains 145.80 MHz. The new uplink frequency is 437.80 MHz and all frequencies are subject to Doppler shifting.

ARISS leaders say that they realize that many hams will miss the packet station that the cross-band F-M voice repeater replaces. Burt the groups leaders say that the cross-band repeater will allow further experimentation of the ISS amateur radio system.

For further information on working satellites and adjusting for Doppler shift, please review Emily Clark's (W0EEC) excellent presentation on AMSAT's website, http://www.amsat.org/amsat-new/information/faqs/Intro_sats.pdf (ARISS)

RADIO LAW: FCC ADOPTS RULES TO ENHANCE NETWORK OUTAGE REPORTING

Back on mother Earth in Washington, the Federal Communications Commission has adopted new rules requiring wireless, wireline, cable, and satellite telecommunications providers to report information about significant disruptions or outages to their systems to the Commission. The FCC says that these reports must be filed electronically. The Commission also ruled that all sensitive information collected as a result of these new rules will be protected from public disclosure. The full story is on-line at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-250543A1.doc (FCC)

**

RADIO LAW: FCC REDEFINES DTV CONVERSION SCHEDULE

The FCC has also taken steps toward deciding exactly which channels broadcasters will end up with when they switch to digital television. By unanimous vote, the Commissioners have set up a timetable that will decide by June 2006 which channels people will tune in on to see their favorite programs. .

FCC chairman Michael Powell says that the vote signals that substantial progress has been made in switching television from its current analog transmission system to digital. He adds that the national dialogue has shifted from wondering if the DTV transition would ever end to exploring when it should end. (FCC)

**

RADIO LAW: CANADIAN GROUPS CHARGE THAT HD RADIO WILL HARM RECEPTION

Meantime, Canada charges that High Definition or Hi Fi digital Radio will harm reception of Canadian stations inside its own border. At least that's the headline from the August 30, 2004 edition of Inside Radio.

According to the story that follows, both the Canadian Boadcasting Corporation and the Canadian Association of Broadcasters have asked the country's technical regulatory agency to protest iBiquity's In-Band On-Channel digital radio system. They allege harmful effects on current A-M reception, especially during nighttime hours. The whole story is on-line at http://tinyurl.com/6uubn and www.insideradio.com (CGC)

**

HAM AWARDS: THE RCC IS BACK AND ITS FREE

Some good news. The Rag Chewers Club or R-C-C award is back, but it will not be sponsored by the American Radio Relay League. Bill Pasternak, WA6ITF, has the details:

--

Its the Society for the Preservation of Amateur Radio -- better known by the acronym SPAR that will be sponsoring the new R-C-C. The group has announced that as of September 1st it will adnminister this fun award and will do so following the old ARRL rules.

According to SPAR, all a ham has to do to get an R-C-C is to present evidence of having had an actual one on one Q-S-O that lasted at least 30 minutes. The QSO can be made on any legal amateur frequency.

In early 2004 the ARRL announced it was discontinuing the Rag Chewers' Club Award due to a lack of interest. Conversations SPAR held with hams seemed to indicate that the lack of interest was due mainly to the cost of the award. So SPAR says that the award will be available free of charge to all licensed radio amateurs.

For the Amateur Radio Newsline, I'm Bill Pasternak, WA6ITF, in
Los
Angeles. Jim.

--

All certificates will be distributed by e-mail as Adobe P-D-F files that you can print and frame. The awards are numbered and endorseable by mode. Complete rules and an on-line application are on the SPAR website at www.spar-hams.org.   (SPAR, QRZ.com)

**

NAMES IN THE NEWS: HAPPY 104 BIRTHDAY TO KJ6KQ

And less we forget, a belated birthday greeting goes out to Bill Diaper, KJ6KQ who turned 104 on August 12th. That's right, we
said
104, and probably making him the oldest living radio amateur in the United States, if not the world.

According to a posting on the Q-R-Zed dot com by Tom Ferguson, N6SSQ, website, Bill is a member of the Pacific Amateur Radio Guild and these days resides in the Masonic Homes in Union City, California. Tom says that there is a radio shack in the basement that Bill used up till a year ago but is very difficult for him to access now. That's because the station is in the basement next to the laundry room. Bill says it is dark and damp down there and must get assistance to get there and have someone tune and adjust the frequency on the rig for him.

N6SSQ adds that the Pacific Amateur Radio sent Bill a flurry of letters and cards on his birthday and that he was very pleased to get them. (QRZ.com)

HAM FAIR JAPAN ATTRACTS 30000 ATTENDEES

Turning to the ham radio social scene, Japan's largest hamfest, the JAIA Ham Fair, was held the weekend of August 21st and 22nd. The venue was Tokyo's Big Sight International Convention Center. Among the highlights of gear being shown were Yaesu and Icom both showcasing their high end $10,000 H-F transceivers. Kenwood did not match in the super high end radio category but had a well attend ongoing demonstration of their ARCP-480 Radio Control Program.

But the manufacturers and dealers were only a small part of the show. Over 170 radio clubs also had booth space at the show. These ranged from large organizations like JAMSAT, the Japan Shortwave Club, and SEANET down to local organizations who use their booth for flea market sales.

Also present were a wide variety of organizations promoting every aspect of Amateur Radio. This included mountain-topping operators, microwave activity enthusiasts and antenna construction experimenters. Operations represented included facsimile, SSTV, ATV, RTTY, 10M FM, 6 Meters, CW devotees, QRP, homebrewing, classic rigs, military surplus and even a contingent from the A-M community.

Ham Fair is Japan's largest annual gathering of radio amateurs from the Pacific Rim. An estimated 25,000 to 30,000 attended this years event. (WIA News)

**

THE SOCIAL SCENE: WSWSS 2004 FALL CONFERENCE IN FRESNO CA

Back on this side of the Pacific, the Western States Weak Signal Society tenth annual VHF and UHF Conference takes place Saturday, October 9th. The venue is the M2 Antenna System Facility, at 4402 N. Selland Ave in Fresno, California. Registration starts at 8 AM with the conference program slated to begin at 9 AM. For more information write to David Peters, KI6FF, 14291 Middletown Lane, Westminster, California, 92683. You can also e-mail David to ki6ff@juno.com (VHF Reflector)

**

HAM RADIO BUSINESS: OAL NO LONGER REPPING DEM

In news from the ham radio business world, David Clingerman, W-6-O-A-L says over the V-H-F Reflector that his company known as the Olde Antenna Lab of Denver, Colorado is no longer representing Down East Microwave, Inc. Dave says to please refer your help questions, pricing information and orders directly to Down East Microwave in New Jersey. (VHF Reflector)

**

HAM RADIO NEAR SPACE: UK BALLOON LAUNCH LICENSED FOR SEPT. 12

G3ZHI reports that a license has been granted for a United Kingdom high altitude ham radio balloon flight. The project is now authorized for operation on 2.500 GHz on Sunday, September 12th. The license has special permission to operate at up to 50,000 feet instead of the usual flight ceiling of 2,000 or 5,000 feet.

The launch is scheduled to take place at about 1.30. Plans are still afoot to relay pictures via the new 13 centimeter GB3FT repeater if the system is completed and on the air in time for the flight. More information on this experiment as it becomes available. (G3ZHI)

**

WORLDBEAT - UK:: NEW RSGB ON -LINE

There's a new ham radio promotional video out and it has a definitely
British flair. And in an effort to help to promote amateur radio, the recently-created Essex Amateur Radio Club has started streaming the new RSGB video "What is Amateur Radio" on the Internet.

The Essex group is providing it at speeds of 26 kb and 57 kb so it can be viewed by those using dial-up as well as broadband. If you want to take a peak it is available in cyberspace at www.essexamateurradio.org.uk (RSGB)

**

WORLDBEAT - NORWAY: HACKER DEFEATS AIRPORT EXPRESS

Meantime on the European mainland the same Norwegian hacker known for developing D-V-D encryption-cracking software has apparently struck again. This time his target is the security system that protects Apple Computer's wireless music streaming technology.

Jon Johansen has released a hacking system on his website that provides a key to unlock the encryption Apple uses for its AirPort Express. The unit lets users broadcast digital music from Apple's on-line iTunes Music Store on a stereo that's not plugged into an Apple computer. This permits other software applications from competitors to work with the proprioritary AirPort Express codec. Apple is reportedly considering taking legal action in the case. (Published reports)

**

RADIOSPORTS: HOST STILL NEEDED FOR 2005 ARDF GAMES

Turning to the world of radiosports, a reminder from Joe Mell, KZ0OV, that a group is still meeded to host the fifth U-S-A Amateur Radio

Direction Finding Championship games. This, in the summer of 2005.

Some prerequisites for being the host include having suitable sites for 2 meter and 80 meter hunts along with the ability to provide foxhunting courses. There are also the organizational aspects to consider. These include providing registration services, housing for the contestants, meeting rooms, transportation to and from the hunt areas and lots more.

If your club is interested in hosting this event, please contact Joe by e-mail before September 15th to homingin@aol.com. Full details about the games and how to become the 2005 host is on line at www.homingin.com (ARNewsline(tm))

**

DX

In D-X, word that K3GV portable VY2 is active on 15 and 20 meters as from Prince Edward through the 12th of September. The island counts as NA-029 for the RSGB Islands on the Air award program. QSL's go to
K3GV at his callbook address. (RSGB)

And while this is short notice, the All Asian SSB contest will take place beginning at 00.01 U-T-C on Saturday, September 4th and will run for 48 hours. Operation is on 160 through 10 meters with stations in Asia trying to work the rest of the world. The official exchange for this one is a signal report and the operator's age.
(WIA News)

Both of these 6-Meter Gonset Communicators are free for pickup in Chelmsford, MA. Both appear complete, but in need of a general overhaul and restoration. These are the original models, with a tuning eye rather than a meter.

If no takers, they'll both go out into the trash at the end of September, and while I really would hate to do this, I have to reduce my collection to gain space, plus with all of my other interests it is unlikely that I'll get around to restoring these. (I'll even throw in a free, RCA TV sweep/alignment generator to anyone who wants it.)

If interested, I can be contacted by email at hhc3141@yahoo.com, or reached by land-line at 978-256-6972 (answering machine if I'm not in my shop).

73's to all! Harry Conover (ex K2JEZ).

Harry C.

Subject: No Messages from Hernando County

Our Volunteer FD here has been ordered to fully man the station from 6pm tonight until released after the storm.

So I'm sorry to say guys there will be no messages from me for Hernando County or surrounding area as I'm the Engineer on an Engine..

If your listening online or live and hear Engine 31 or 32 that will be yours truly..

Hope everyone stays safe and no one suffers any serious damage..

John Henault

Amateur Radio Newsline™ Report 1413 – September 10, 2004

Amateur Radio Newsline report number 1413 with a release date of Friday, September 10th, 2004 to follow in 5-4-3-2-1.

The following is a Q-S-T.

Hurricane Frances strikes Florida and ham radio is prepared. Hear the ham radio first responders in action on Amateur Radio Newsline report number 1413 coming your way right now.

(Billboard Cart Here)

**

RESCUE RADIO: HURRICANE FRANCES VS. HAM RADIO

Hurricane Frances pounded Florida with high wind and heavy rain after it smashed across the state's East coast. Close to 4 million residents lost power and telephone service. Cellular phone networks that survived Frances's gale force winds quickly became overloaded. Enter ham radio. Amateur Radio Newsline's David Black, KB4KCH has been following the story from our South-East bureau in Birmingham, Alabama:

--

When Hurricane Frances hit Florida on Labor Day weekend, the storm ripped roofs off buildings, toppled trees and cut power to about 4 million people. Also lost was part of the states telephone and cellular service. This created a communications vacuum.

But hams affiliated with SATERN - the Salvation Army Team Emergency Radio Network, A-R-E-S, and the Hurricane Watch Net were expecting Frances. Radio amateurs had been tracking this storm as it ravaged its way across the Caribbean. And it was ham radio that let the world know of the destruction the giant storm had caused as it hit some of the islands:

--

"Roger roger. On Elutheria Ill say about 40 percent of the structures have damage. In the Rainbow Bay area where I live I would say about 70% of the hhomes here have structural damage. Over."

--

Once a Category 4 hurricane with winds of 145 mph, Frances had weakened to a Category 2 storm as it neared Florida. Winds dropped to a peak of 105 mph as it made landfall at Sewall's Point, north of Palm Beach, around 1 a.m. Eastern Daylight Time on Saturday, September 4th. Ham radio operators affiliated with the Hurricane Watch Net tracked its approach:

--

“This is KA5E with the Hurricane Watch Net. We are currently taking measured weather reports out of the affected area for Hurricane Frances. Do I have any stations on with pdates or signifigant weather reports. KA5E, over.”

--

The powerful storm hit Florida with ferocious winds and sheets of rain. The hurricane was so large and slow moving that its western outer edges had began arriving on the east coast on Saturday morning. On Sunday morning its eastern edges were still pounding the coast from which 2.5 million people had been told to flee. Repeaters interconnected using I-R-L-P and Echolnk were pressed into service to help coordinate the latest round of evacuations:

--

“KC4PNC KB1CYO net control. Go ahead sir,”

“They have called for mandatory evacuation for Hillsboro county for manufactured homes and also mobile homes. They have not ordered a mandatory for low lieing areas but they are strongly recommendng it.”

--

And as evacuee’s poured into shelters, communications volunteers were needed. A call was put out over the interlinked repeater network and the hams responded

--

“We are looking for any volunteerr Amateur Radio operators to help with shelters. We have eight shelters open right now. Those are being manned. However, since its a declared evacuation all of the other shelters will be opened and we are looking for vlunteers to man those shelters. KC4PNC.”

--

As Frances path of destruction hit Florida's central Atlantic coast counties, blinding rain squalls drove clouds of sand into the air. At the same time high waves thundered onto the beaches. One ham watched as his rain gage was torn away and white caps pounded ashore:

--

“Any kind of rainfall accumulation?”

“No, that gage blew away but I can tell you that we are in a high tide area right now and I can see the tides up about a foot and a half and I have water coming over my seawall. But its not a problem. We are still at a much higher elevation. The water is over the seawall along the Intercoastal Waterway.”

--

As palm trees rained coconuts and then toppled over and buildings suffered extensive damage there was also a tragedy at sea. And the U-S Coast Guard turned to Amateur Radio for help:

--

“I want to remind the net that the Coast Guard has asked us to lend assistance in the search for the Anna Marie. It is a vessel that went down off the coast of Sarasota this evening about 10 to 12 miles out. Any assistance or any information on the Anna Marie that went down with the crew 10 o 12 miles out of Sarasota, the U.S. Coast Guard would appreciate your assistance.”

--

At airtime its not known what happened to the Anna Marie nor the fate of its crew. But as the search continued, there was yet another threat. Early on Sunday the 5th, the massive weather system spawned a tornado, and the warning went out over the I-R-L-P ham radio network:

--

“The tornado is expected to be by Bostwick by by 2:45 Eastern, Forholm by 3:00 a.m. and thats all I have.”

--

As that twister touching down the National Weather Service office in Jacksonville issued a tornado warning for Northern Clay County including the city of Orange Park. Also affected were St. Johns, Clay, and Putnam Counties. And as dawn was breaking radar picked up a developing tornado near Doctors Inlet moving West at 45 mph. Only some damage to roofs was reported.

But reporting weather was not the only chore radio amateurs were involved in. Another as health and welfare. Letting worried relatives and friends know about those stuck in Frances path. Many like this central American station who was happy to hear that the hurricane was headed away from his daughters location:

--

“OK. Great. Thank you very much. I appreciate that information. We are here in a location where we do not have any TV or any other communication. We are on the beach on the West coast of Panama. So thanks very much I do appreciate it. This is HB1XRO and the handle is Bob.”

--

By Monday afternoon, Frances had crossed the eastern Gulf of Mexico and made its second landfall in Florida's northwest Panhandle section some 20 miles south of Tallahassee. Now it only a tropical storm with sustained wind near 65 mph. Damage was mainly to power and telephone lines. At that point the forecasters were predicting the storm would move north-northwest at about 8 mph, and was not expected to regain hurricane strength.

Frances soaked Georgia, dumping 11 inches of rain in a 24 hour period in the town of Patterson.

Media reports blame Frances for at least seven deaths in Florida, including two people who were killed Saturday when the roof of he building they were in collapsed. There were also two deaths in the Bahamas. One of these was a teenager who was reportedly electrocuted when he tried to hook up a generator to a power mains that was still on.

With thanks to the hams who supplied the storm audio over the Internet used in this report, I’m David Black, KB4KCH at the South-East bureau in Birminham Alabama for the Amateur Radio Newsline. (ARNewsline(tm))

--

**

RESCUE RADIO: HAM RADIO PREPARES FOR IVAN

And its not over yet. As we go to air Hurricane Ivan is making its way cross the Caribbean and could strike the United States. CQ's newsdesk reports that Amateur Radio at the National Hurricane Center, WX4NHC, was to be reactivated for Hurricane Ivan at 2 PM EDT Thursday, Sept. 9, and will be active on Friday-Sunday 8 AM-11 PM EDT. The Hurricane Center will be on the Hurricane Watch Net on 20 meters as well as the VoIP Hurricane Net,. The latter is a combination of IRLP and Echolink stations.

The Cayman Islands and Jamaica are the next locations in the path of this extremely dangerous Category V Hurricane which now has maximum sustained winds of 160 MPH per the latest advisory issued at 5 AM EDT Thursday morning.

VoIP Net Control Station Rob Macedo, KD1CY, says they are trying to coordinate with the IRLP node owners on the Cayman Islands and Jamaica on usage of their nodes and liaisons to those affected areas. Currently there are no Echolink or IRLP nodes in Cuba.

National Hurricane Center advisories indicate that the path of Hurricane Ivan is not clear after it passes over Cuba on Sunday. Residents in the affected area should monitor the situation closely. There is a possibility that the hurricane's forward progress could slow and emergency nets may be activated for an extended period of time. It also means that ham radio communications volunteers could have a lot more to do in the coming days. (CQ)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the repeaters of the Condor Connection intertie serving the great American South-West.

(5 sec pause here)

**

RESCUE RADIO: FIRST RESPONDERS SAY THEY NEED INTEROPERABILITY

Meantime, three years after the nine eleven terrorist attacks, thousands of police and fire divisions in cities and counties across the United States still do not have coordinated communications capabilities. So says the First Response Coalition and Amateur Radio Newslines Norm Seeley, KI7UP, has the details:

--

The First Response Coalition calls this lack of interoperability an unresolved national crisis and it has decided to take on the FCC and big business to solve it. This as the organization reaches out directly to more than 43,000 local police and fire officials to solicit their help.

First Response wants Congress to overturn the FCC decision to award spectrum to Nextel in favor of a plan that deals both with interference problem and the interoperability crisis. Gene Stilp, who is the First Response Coalition coordinator says that the FCC plan involving Nextel is wrong for police officers and firefighters. This is because it only takes on only part of the interference issue. Moreover, it does not do anything about the lack of interoperability between emergency response groups.

The First Response Coalition says that this outreach program is getting a very favorable grassroots response. So far over 17 fire chiefs have joined ranks with the group in opposing the FCC's current plan for what they call a give away of taxpayer-owned spectrum.

For the Amateur Radio Newsline, I‘m Norm Seeley, KI7UP.

--

About the only emergency responders these days who have full two way radio interoperability are radio amateurs. Hams had voluntarily set world-wide communications standards many years ago. (First Response Coalition release)

**

RESCUE RADIO: AMBER ALERT LINKS UP TO THE WEB

The nation's Amber Alert system has become a web available tool. This, thanks to a portal made available by the E2C company of Scottsdale, Arizona.

Until now, Amber Alerts have been a primarily radio based technology. This meant that messages had depended on the nation's Emergency Alert system for relay and delivery. The new Web-based system can process and transmit the same emergency information more quickly and make it available to a wider variety of devices. It also comes with software that pinpoints the location of a child abduction and sends out emergency notification targeted to that geographic area.

As of now, Amber Alert managers in 11 states have access to the new portal. Use of the system is expected to expand to the 49 states that have statewide Amber Alert systems. Hawaii has no statewide system but has several local alert networks. (E2C)

**

THE BPL FIGHT: VK 4-WHEELERS JOIN BPL FIGHT

A Four Wheel Drive hobby group has joined the fight against BPL. Its happening down-under. WIA Newscaster Phil Waite ,VK2DKN, reports:

--

The VKS737 4WD HF Radio Network, joined the fight against BPL last week, following the recent WIA news broadcast by Jim Linton, VK3PC, highlighting the BPL industry's attack on interference protection for so called `recreational radio services' and an approach from WIA Director, Glen Dunstan, VK4DU.

VKS737 are currently circulating their members with information about the threat BPL poses to their activities, and encouraging their members to lobby politicians on the issue.

The VKS737 network is used extensively for emergency communications in remote areas, as well as serving the communications needs of outback travellers. Their current membership is around 7,000 and they potentially reach 250,000 Australian 4WD owners.

Many of their network base stations are in urban areas potentially affected by BPL and VKS737 members are rightly concerned about the threat presented to their HF communications. Their organisation is also associated with the Australian Citizens Emergency Radio network, who provide similar services on citizens band frequencies.

Phil Waite, VK2DKN, for the WIA National News.

--

The Wireless Institute of Australia is discussing ways the two organizations can assist each other in the fight against BPL. (WIA News)

**

INTRUDER WATCH: STRANGE SIGNALS AT 7238 KHZ

According to Bob Gonsett, W6VR, for the past three weeks, hams in the southwestern U.S. have been reporting a mysterious signal in the 40-meter band. One party described it as a "mechanical sound." Another speculated that it was "data."

Engineers at Communications General Corporation in Fallbrook California took a quick look at the situation on Septeember 6th. And at 3:20 P-M Pacific Daylight Savings Time the company found several close-spaced CW carriers. The four strongest signals at CGC's lab were on 7238.063, 7238.150, 7238.237 and 7238.412 kHz. The signal on .237 was the strongest of the group and the frequencies reported should each be accurate to better than plus or minus 30 Hz.

Communications General says it is not sure if the signal was coming from one specially modulated transmitter or from transmitters at different locations. Bob Gonsett adds that it will be interesting to learn the source or sources of these transmissions. (W6VR, CGC)

**

SAFETY: RADIO ENGINEER ELECTROCUTED WHILE WORKING ALONE AT TOWER SITE

The hazards of working near power lines has been brought front and center again. This with word that a Wyoming broadcast engineer has killed while working at a transmitter site in Colorado.

Thirty nine year old Robin Bradley Thomas was killed while working alone, trying to install a radio transmitter. The accident happened about 18 miles northwest of Red Feather Lakes in northern Colorado. Indications are that Thomas of Cheyenne died when he accidentally came in contact with high-voltage and was electrocuted. Thomas was described as an experienced engineer who contracted out his services. (CGC)

**

RADIO LAW: CELLPHONE PROVIDERS SUED OVER LOCKED PHONES

A consumer watchdog group sued three cellular telephone companies. This. for "locking" their phones to make it harder for customers to switch carriers.

The Foundation for Taxpayer and Consumer Rights is the group that filed the suit in Los Angeles. It accuses AT&T Wireless Services Inc., T-Mobile USA Inc. and Cingular Wireless, of using software in their handsets that prevents them from being used on a competitors' network.

All phones in question use Global System Mobile communications, or GSM technology which effectively limits a handset to a specific carrier using a non interchangeable SIM card. The lawsuit complains that this is an unfair and deceptive business practice under California state law.

The phone companies are defending their policy. They say that they routinely subsidize handset cost and would loose substantial revenue if they allowed customers to easily use those phones with another carrier. (Foundation for Taxpayer and Consumer Rights)

**

REPEATER COORDINATION: METROCOR MORITORIUM TO END DECEMBER 15

Attention repeater owners in the New York metro and surrounding area. An impoerant deadline is aproaching.

You may remember that your new area frequency coordinator MetroCor had put in place a two year moritorium on new co-channel coordinations when the group came into being. It had also asked existing repeater operators who have documented proof of expired coordination from the now defunct Tri State Amateur Repeater Council to update their coordinations with MetroCor.

In a posting to QRZ.com, MetroCor's Mario Sellitti, N2PVP, says that this moratorium had minimized the possibility that new coordinations might inadvertently displace longstanding users of the spectrum. It also helped to avoid creating disputes where none previously existed.

Now, says Sellitti, this period must now come to an end. He says that MetroCor will be terminating the moratorium as of midnight, Saturday, December 15th.

But he adds this qualifier. Sellitti says that anyone in the area having a repeater or knowing of one belonging to another ham, and that repeater qualifies for this exception, to please refer to MetroCor’s on-line F-A-Q in item No. 11. This will give you or the person with the other machine the information needed to gain new coordination through MetroCor. Those in need will find it on-line at www.metrocor.net/faq.htm. (MetroCor, QRZ.com)

THE SOCIAL SCENE: W9DXCC CONVENTION IN ILLINOIS IN SEPT

Turning to upcoming social events, Joe Shrader, W9JUV says that the 52nd annual W9DXCC Convention and Banquet takes place Saturday, September 18th. This years venue is the Holiday Inn Chicago in Elk Grove, Illinois with noted DXer and author John Devoldere, ON4UN, as the featured banquet speaker.

John Devoldere leads the world in countries worked on 80 meters with over 350, and is first ham outside of North America on 160 meters with over 290 contacts. He is also an avid contester was elected to the CQ Contest Hall of fame in 1997. Devoldere is also one of the best speakers in the hobby.

This is a show you won't want to miss. For registration and lodging information visit the www.qth.com/w9dxcc on the world wide web. (W9JUV)

**

THE SOCIAL SCENE: SVHFS IN NC NEXT APRIL

And make plans now to attend the 9th Annual Southeastern VHF Society Conference. The 2005 gathering will be held in Charlotte, North Carolina next April 29 and 30.

Guy Titman, K4NUS has offered to be host and facilities chair for 2005 gathering. More information is on the web at www.svhfs.org (VHF Reflector)

BREAK 2

This is ham radio news for today's radio amateur. From the United States of America, We are the Amateur Radio Newsline with links to the world from our only official website at www.arnewsline.org and being relayed by the volunteer services of the following radio amateur:

(5 sec pause here)

**

HAM TECHNOLOGY: HAM DREAM DIGITAL VOICE QSO

What is believed to be the first two-way digital voice contact in South Africa took place between ZS1AN and ZS1AU on August 10th. Contact was made on 15 meters with both amateurs using Ham Dream software for the QSO. Amateur Radio Newsline's Bruce Tennant, K6PZW has the details:

--

Ham Dream is an open-source version of the Digital Radio Mondiale broadcasting standard. It was adapted for amateur use by HB9TLK and gives hams the ability to talk almost noise free. Here's how.

Speech is converted to digital data using a low-bitrate vocoder analog to digital converter. The data is then transmitted using a high-speed modem. At the receiving end the data is decoded to recover the audio at the receiver. Although still in the evelopment stages, there is worldwide interest in Digital Voice, which can deliver very high signal-to-noise ratios over medium quality narowband S-S-B channels.

For those who want to experiment, HamDream software can be downloaded free of charge from the South African Radio League's website at www.sarl.org.za.

For the Amateur Radio Newsline, Im Bruce Tennant, K6PZW, reporting.

--

Further information on digital voice in ham radio is available on HB9TLK's website. Its in cyberspace at www.qsl.net/hb9tlk (GB2RS)

**

EMERGING TECHNOLOGY: TiVO OVER THE NET

Federal regulators have approved technology allowing TiVo subscribers to send copies of recorded shows over the Internet. In its decision, the Federal Communications Commission said the new feature by Alviso, Calif.-based TiVo has enough protections in place to prevent mass distribution of copyrighted material.

The technology would allow a TiVo subscriber to download broadcasts to a computer and send copies of recorded shows over the Internet to an office or home or to a small circle of friends, as long as they are on the subscriber's registered account. The Motion Picture Association of America, the National Football League and others complained that the new service would allow the 1.6 million TiVo subscribers to redistribute shows over the Internet to virtually anyone, anywhere. (Published news reports)

**

EMERGING TECHNOLOGY: FCC TAKES NEXT STEPS TO PROMOTE DIGITAL TV TRANSITION

Its full speed ahead with the conversion to digital television. So says the FCC as it issues a Report and Order that it says implements several steps necessary for the "continued progress of the conversion of the nation's television broadcast system from analog technology to digital television.

The paper covers almost every aspect of the conversion process over the next several years. It also highlights the coming events and should be considered "must reading" for those interested or involved in the future of digital T-V. You will find it on-line at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-250542A1.doc (CGC, FCC)

**

WORLDBEAT: NEW UK REPEATER SERVES LONDON AND KENT

And if you are planning a trip to the UK, don’t forget your reciprocal license and your HT. And be sure to try out a new repeater serving the needs of hams in the North Kent and South East London England area.

Its call is GB3OK and it is sponsored by the Bromley Repeater Group and it went on the air on the 16th of August. It transmits on 145.650 MHz with the standard 600 Kilohertz input offset and requires a 103.5Hz tone to access the receiver. The trustee of GB3OK or repeater keeper as the British call them is Tony Ravelini, G1HIG, in the city of Kent. (GB2RS)

**

DX

In DX, HA3JB tells the Ohio Penn D-X Newsletter that he will operate as SU8BHI from Cairo, Egypt. This, from September 21st through December 20th. Activity will include CW, PSK, RTTY, SSTV and some SSB. QSL direct to HA3JB. (OPDX)

And UA9OBA, has been active as JT100M. This is a special callsign being used until September 13th during the Mongolian leg of the Altay-Himalaya Transasian off-road expedition. Activity has been mainly on 20 meters SSB around 14.180 Mhz. QSL via UA9OBA. (OPDX)

**

THAT FINAL ITEM: THA FINAL ITEM: A KEYLESS T-HUNT

And finally this week, a Michigan ham radio operator from the Ford Motor Company was part of a two man team that has solved the mystery of malfunctioning remote keyless car door openers, garage door openers and other such devices in Las Vegas, Nevada. A problem with R-K-E devices that had baffled many residents since a massive outage began last February.

Las Vegas resident Bill Zawistowski was one of those complaining. He and others vented their frustration to anyone who would listen including the FCC. Ford responded by flying in two R-F detectives. Earl Morse, N8SS, represented the auto maker and Nabil Hachem was from Alps Automotive, which makes the keyless car-door devices. And it did not take very long for Morse and Hachem to figure out what was happening:

--

Morse: “When we got there we discovered a signal in the paassband of the RKE receivers which was actually strong enough to keep the RKE from activating its own receiver in the vehicles. We investigated further and found it to be a stuck repeater. We can leave it at that.”

--

Morse says it was not much different than a ham radio T-hunt except for the frequency:

--

Morse: “Having experienced Fox Hunting first hand. the only difficult art was shifting all my equipment to that frequency. All of my antennas were relatively useless because they were cut to 2 meters an 440 so we had to make some new antennas for the 315 Mhz. band.”

“We did have one advantage in that the RKE group had purchased a Doppler direction finder and we utilized that a lot.”

--

Morse tells Amateur Radio Newsline that once they found the transmitter it only took a few phone calls to get it turned off. The problem did surface again a week later but this time one landline call got it to go QRT for good. (ARNewsline (tm))

**

NEWSCAST CLOSE

With thanks to Alan Labs, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's W-I-A News, that's all from the Amateur Radio Newsline(tm). I currently have a Tech Plus license. Although I'm basic inactive, except for listening to weather reports from the storm watch teams.

What do I need to do to qualify for General Class?

You would need to take (and pass) ;-)
Element 1 (5 wpm Morse code)
Element 2 (Tech written)
Element 3 (General written)

Your current Tech Plus license is proof of 1 and 2, so all that you
will need to add is the Element 3 test, at any VEC session.

My story may not be extremely spectacular, but I think it has a rather amusing moral...

I had for a number of years not bothered screwing down the top cover of my 13.8VDC 10A power supply, for whatever reason. Of course, every so often the top cover would move and expose the inside working of the supply, but that wasn't really a problem!(?)

Then one day, while doing my electronics trade course, we moved to the subject of AC safety and how not to fry yourself! Very interesting lesson and I scored 100% in the final exam for that subject.

Then I came home, rather pleased, reached down to switch off my power supply, and promptly shorted the 240V AC main switch with my finger! What was that about AC electrical safety again????

Another event, some years later, I was working on a tape deck on my workbench. I had to reach over the tape deck to get a screwdriver from the back of the bench, but of course I forgot it was still pluged in and promptly shorted the AC transformer inout with my forearm...

Luckily for me we had just installed earth leakage breakers and it didn't take long for it to trip... After that, whenever someone asked me "how long do these breakers take to cut out" I would always answer with "oh, about ARRRGG"

Cheers

Martin, VK2UMJ

My dad tells a story of his days working as a maintenence engineer in a building where the power was carried along exposed buss bars. Another worker had a screwdriver in his back pocket and backed into a buss, blowing himself across the room and leaving a notable set of scars from the molten screwdriver blade.

High school.
My buddy Pete has one of those continuous AC electrical outlets on the side of his desk. You know. Two continuous brass strips in a foot long plastic housing with two slots, into which you shove the (older two bladed) plug.

Well, one day he needed some line cord, which he ALSO had hanging on the peg-board on the side of his desk
SO... He reaches around the end...grabs some line cord and proceeds to cut off a piece with scissors...

Blam! ... notched scissors!

Outlet strip had the same kind of brown, two conductor cord.

On a vaguely similar line my father was rewiring an outside building and
carefully removed all the fuses from the fuse box before cutting out all
the old cabling. He then came across a cable he had forgotten and cut
this too, BANG!! It was the input to the fuse box. One very badly melted
pair of cutters and a rather startled father.

I gotta. I just gotta.

About 25 years back, I was a new systems programmer for a government agency which I'll cleverly call WeBuildHighways. Our sister shop, the Department of inHuman Services, was fairly close, and we spent a fair amount of time visiting and swapping hints and kinks.

One day I was there while some remodeling was being done: an old door wsa being blocked and a new one cut. I heard a Skilsaw fire up, saw a blade movingd ownward, and cringed: there was a quad-box about a foot below the blade and in its path.

My counterpar was a bit quicker, and shouted "Turn Off All Your Terminals RIGHT _NOW_!!" -- just before the blue flash and the great dark silence.

This was before PCs, and so we only lost some 3270 terminal sessions to the mainframe. It was ... interesting.

Another time I'll tell about The Guy Who Blew Himself Through The Door.

12 years back there was a CB'er that had a double 3-500 Z amp with 3500
volts on the plate that lived next door to me.

One day he noticed he was running about half power instead of full bore so
he popped the top of the amp and noticed one of the wires on the tube caps
(PLATE) had come unsoldered.....so instead of turning the amp off he melted
the solder a bit with his insulated soldering iron and forced the wire back
into the molten puddle....It worked!.......Then holding a large roll of bare
solder in his hand he added a bit more to the molten solder

It didnt take him long to let go of that roll of solder in his bare hand!!!

His entire hand was burnt white!

Reckon we all know who posts from a Bellsouth account.
Wonder what would happen to that account if Lloyd was to send copies of the
posts to BSouth?
It would be a shame for the moron to lose a DSL account, or would it?

Funny to see a net kop wannabe calling another the same name.
Pot calling the kettle black.

As a law-abiding amateur for over 30 years, I feel I must speak up on
the ex-KG6IRO matter. Mr. Gerritsen must think the laws of this
country do not apply to him, or else he is incredibly hard-headed.
What more does the FCC have to do to convince him that it is illegal
to operate an amateur station in the United States without a license?
The man has been in prison twice, he has had a $10,000 NAL levied
against him for unlicensed operation of an amateur station . . .
hasn't he gotten the message yet?

Apparently not. As to his blustering about his "right to say whatever
(he) wants over the ham radio", with or without a license, I will say
he is off base on this as well. We as amateurs do not have any right
whatsoever to use foul or indecent language over the public airwaves,
nor do former amateurs have the right to operate a station once their

licenses have expired and/or are/were revoked for any reason. As well, there is an unwritten law among amateurs stating that under no circumstances should subjects related to sex, religion or politics be discussed over the air. This is not an FCC rule; rather, it is common sense, as it applies to non-amateurs in general society as well. The discussion of these three subjects, on or off the airwaves, can lead to arguments and can even end long-standing friendships. The reason is that everyone has their own beliefs, opinions and so on in regard to these subjects; some people get extremely angry or even violent if someone offers any kind of opposing opinion on them. This kind of thing is bad enough in society in general; we as amateurs certainly do not need this kind of discord on our bands as well.

As to my comment about foul language over the ham airwaves, the FCC, as all amateurs are or should be aware, does forbid the transmission of such over our bands; amateurs have been fined and/or had their licenses revoked for violations of Part 97's rules regarding this. We must also keep in mind that our transmissions on any ham band are being heard, not only by other amateurs, but by non-amateurs as well--some of whom may be teenagers or younger. There is enough of a problem in this country with teenagers or younger kids being exposed to foul language over standard FM radio and by means of X-rated (or worse) VHS videos or DVDs, not to mention music CDs with extremely suggestive lyrics or messages and other such junk on cable TV channels such as MTV, et al.; we must not compound the problem by exposing children to guttersnipe language over the amateur bands as well.

(to reply to this email, replace   csa.org   with   hotmail.com)I think I will be listing my Radio equipment on eBay Auction in the next few days. That is, unless someone would like to do a "direct sale". All of this equipment was purchased from AES Orlando, in 2003. The entire setup has been used less than a total of 3 hours. I got my shack set up, (in South Carolina) and we had an ice storm which took out my antenna. I never turned the equipment on again, just boxed it up. Now I am in Florida, and cannot really use it where I live, so will let it go. I have: Kenwood 570S(G) Transceiver; Kenwood PS53 heavy duty power supply; Kenwood SP23 Speaker; MFJ 962D tuner, and a Heil Goldline GM-4 Microphone w/Stand. Total cost of this setup was near $2000.00. I will probably list the items as a group, as I dont want to piecemeal this stuff out. I will probably list with a reserve of $1295 + shipping. If anyone is interested at that price, and wants to save me the eBay fees, I can send pics. By the way, I am always selling stuff on eBay, mostly Confederate Banknotes.. If anyone would like to check my eBay feedback (1300+), my seller name is   rebel

Hello Everyone,

I would just like to tell you about my new Amateur Radio swap page and would like to invite you to visit. I still have some changes to make but everything seems to be up and running.

My new web site is called The Online Hamfest!(tm) and it's located at:
http://www.onlinehamfest.com

My web site is new and there's not much to look at yet but I've tried my best to make it look like a real live hamfest. There is a flea market area, free door prizes, a testing session and more goodies like a live chat frequency and games. Hopefully I have created, "The world's first live online hamfest!" :)

73
Dave

That rules change came soon after I got my Novice ticket. The date the
change went into effect, IIRC, was November 22, 1972.

Co-worker of mine wore his nice shiny new anniversary wrist watch
(with metal band) while working around his car battery. Pushed his
hand down into a tight spot and shorted the hot terminal to ground
with the band.

He said there was a flash and suddenly the band was starting to glow.
He jerked his hand out almost instantaneously, and the watch and band
sailed across the garage, hit the wall, and crashed to the concrete
floor.

He wore a bandage around his wrist for a couple of weeks, but all he
has to show for it now is the brand around his wrist that the
watchband left behind.

I have no idea what he told his wife....

Civil Air Patrol Activity

From St. Pete Times:

"The Civil Air Patrol, which has been taking damage assessment photographs, took on a new job: Locating and silencing about 700 emergency locator transmitters that are sending off signals from damaged boats and airplanes. In normal times, these devices automatically bleep up to satellites when they are jarred in accidents. Now they are sending out signals in droves, hampering efforts to identify true emergencies."

ELTs are on 121.5, 243.0 and 406.0.

From the below frequencies, local CAP is on 148.15 (repeater).

NATIONWIDE C.A.P. CHANNELS ABOVE 30 MHz

Local "Big Stick" frequencies are: 145.43, 146.76, 145.29, 442.95, 443.45. The whole system is linked, so you should hear the same traffic on all the frequencies.

Down in the area there are several ham repeaters operational.

On HF / Shortwave, most of the activity is on 20 meters (14 MHz).
14.265 SATERN - Salvation Army
14.300 MMN - Maritime Mobile Net
14.325 HWN - Hurricane Watch Net

Search and rescue teams often include ham operators and work simplex
(non-repeater) frequencies. The Florida Task force was using at least
146.55.

Hi all, I picked up a Bencher Iambic paddle. It was not wired for any
keyer.
Question, what is the correct way to wire it up??
Does the dit belong on the left paddle or the right??
Is there a correct way??

Dits on the left, dahs on the right... if you're right handed.
I assume you have never done CW on a keyer or bug....

Don't bother with that old technology. If it's the gold plated one
I'll offer ten bucks<:-))

Normally they are wired so your thumb sends the dits.
wire accordingly for right or left handed operation.

I picked one up at a swapfest and found it was backward (dits on the right) or wired for a lefty so I just swapped the wires on the bottom.

These 5 items are now available for bids on eBay. If you have an interest, check them out at:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=40067&item=5716671376

Thanks! Gene (PS Reserve is a "little" lower than $1295)

Usually, configure so your thumb sends the dits, wire accordingly for right or left handed operation. Some folks connect it in reverse and it is really a personal preference, but you may be in for a surprise if you operate some else's station. If you do encounter a "backwards" paddle, a quick fix that works on some paddles is to turn them upside down! I did this at our last Field Day rather than rewire temporally, however a lefty was right at home with it rightside up (;-)

Dit on the Left side  (same side a "BUG" uses- those mechanically
generate dits, with a pendulium), but then mine is backwards--
learned on a buddies key , was left-handed!  When in doubt, simple
mod is double pole, double throw - glue under side of key, "X" strap the
far sides , and wire to key- wire the center to rig-  as a reverser
switch-  then anyone can use it even if trained on a backwards setup!
Jim NN7K  (P.S. offer 15 bux for gold one!  ;)

> Is there a correct way??

It does not really mater. It is usually the dits on the left paddle if you are right handed. REason being that is the way the mechanical bugs are wired. The thumb is able to hit the paddle harder to make the mechanical bud do the dits. With no hard hitting needed for the electronic bug it will not mater but most will learn dits with the thumb.

Look at the vibroplex page at URL:
http://www.la.ca.us/frandy/

sez:
The Vibroplex was based on a lever that rotated around a vertical pivot.
Pushing a paddle mounted on one end of the lever to the right and holding it
there caused a spring-mounted contact on the other end of the lever to
vibrate against a stationary contact, making strings of dots.

Dashes were made manually by pushing the lever to the left and releasing it.

Dits on the thumb side, so left side should be sending dits if your
right handed.

Mine is wired for right handed CW operating, but I also have a MFJ
Memory Keyer that has a button on it that will reverse the keys for
left handed CW operators.

One I use exclusively, aside from the ARRL DX Bulletin is the
Ohio/Penn DX Bulletin (more extensive than the ARLDX bulletins).

Ohio/Penn DX Bulletin: http://www.papays.com/opdx.html

Both can be read on the WWW or received through e-mail.

Stacey/AA7YA

I used to have a nice collection of radio amateur handbooks from the 1960's,
70's and early 80's.. unfortunately, those went missing several years ago
due to various problems (theft, water damage, etc).

if anyone has any laying around and would be willing to donate 1 or 2, let
me know. some of those old books contain info you just can't find in the
new publications these days.

If you folks happen to have any laying around taking up room, please do let
me know (my e-mail is in the signature below).

thanks.

I did not know that there were FAKE radio's

Anyway.

The modem is not given a IP.
Did you use a static DHCP by copying the MAC address and setting it to

a IP, say 192.168.105 or whatever for your box.
By setting the DMZ to that IP you should have no restrictions to that IP.

My IRLP LINUX box, had a simiular issue.
Used DHCP to assign a IP, set up the necessary ports in Virtual server and was ok.

Dlink is good on the phone with tech support if you still have issues.

Good Luck!!

Is he still trying to use the ham bands? If so, time for
Riely to once again lay the smackdown on his candy-ass.

<<<Splinter>>>
Still waiting for his ticket.

Yep you is right

DX shud be at   rec.radio.amateur.dx

There are guidelines as to what Ham topics go where -- at URL:
http://faqs.jmas.co.jp/FAQs/radio/personal-intro

But being NG's are mostly unmoderated -- folks put their for sale items on all of them.
As well as the OT political rants. Oh well.

Playing NG cop will do little good -- at least it hasn't for the past 4 years (;-(

Thank-you so much for the feedback and information thus far.

Although I really appreciated the information, I do not want to get too hung up on the coiling of the coax. This weekend I plan to upgrade the gauge of the wire from #8 to #3. Also I have now bonded the cold water pipe entering in the basement floor to the exterior ground plate.

Any other feedback on the pictures below are appreciated......

Lloyd

- 3 ground rods 10' each around the tower (bonded together)
- 2 ground plates (one outside, one in the shack, also bonded together)
- lightning arrestors and/or feedthrough adapters
- tower to mast ground
- interior coax switch (not shown)

I provided some pictures below:

http://www.telusplanet.net/~homac/exteriorground01.JPG

http://www.telusplanet.net/~homac/exteriorground02.JPG

iss qso on echolink monday 2004-8-16

on monday 2004-8-16 at 18:05 UTC the iss will have a 10min two way qso with the Challenger Learning Center at Prairie Aviation Museum, Bloomington, IL

questions will be asked by a group of students

the plan is to stream the international space station audio in the echolink amsat conference room

room number 101377

you are welcome to drop in and listen to the qso

if you would be willing to help and stream an iss school/college contact then please let me know

that way the contact could be heard around the world

hams could then transmit the audio locally so any school/college with a scanner could also listen to it

for up coming iss events visit

http://www.amsat.org/amsat/ariss/news/arissnews.txt please contact me if you are willing to help or have any questions

Hi folks,

I need some help trying to get Echolink working, I have been using the troubleshooter on the support site to no avail.

Here is my setup:-

DSL Modem - LAN IP 192.168.8.1
This assigns DHCP to my DLink DI614+ router which has an assigned WAN IP of 192.168.8.2
The Modem has DMZ enabled to 192.168.8.2 which should pass all traffic through into the WAN port on the router (I think). Http to my linux web server works ok.

The DI614+ has an IP of 192.168.0.1 and supplies IPs to the LAN, the PC running Echolink is assigned 192.168.0.100

I have tried everything possible in the DI614+, DMZ to 192.168.0.100, that doesn't work. Applications, set a rule with trigger on 5200 TCP allow UDP 8198-8199, doesn't work. Tried Vritual Server to 192.168.0.100 with UDP 8198 and 8199, nothing works at all!!

I have also tried setting virtual sever rules in the modem forwarding 8198 and 8199 to the WAN port of the DI614+ (192.168.8.2) but nothing works.

I presume that if DMZ to 192.168.0.100 won't work then nothing will, can anyone suggest anything please??????

Thanks,
Andy.

I have 2 Saber III UHF Securenet radios with DES-XL installed in them
and working currently, the radios are 8/10. I also have the T3011 BX KVL

Keyloader for the DES-XL so you can change your Securenet "key". I have
2 smart chargers for the radios and a charger for the KVL. The KVL has a

new battery bought last year I think and the radios have several
batteries bought over the past several years.  I also have the
instruction book
for the KVL (something hard to find now days). The radios also have
antennas
with them. I will gladly program 10 channels in them for you for
nothing. I am
still currently using these but will be upgrading them soon to an APCO
25
SmartZone Astro XTS5000 III 800MHz so I am looking to sell these as
a unit only and will not break the set. Please contact me off line for
more
```

```
information. Located in zip 35080. $2000.00 for the entire setup.
Shipped
only in the USA since there are DES-XL boards installed.

Amateur Radio Newsline™ Report 1409 August 13, 2004

Note: Ladies and gentlemen This weeks newscast is dedicated to the memory of the late Roy Neal, K6DUE who passed away a year ago on August 15, 2003, following heart surgery. Roy was our friend, teacher and served as the first elected vice-president of Amateur Radio Newsline after it became a 501(c)(3) nor-for-profit corportation. We miss him very much. "So Roy old buddy: This one is for you."

de WA6ITF

Amateur Radio Newsline report number 1409 with a release date of Friday, August 13th, 2004 to follow in 5-4-3-2-1.

The following is a QST. Australian hams ask for a new ham band at 500 kilohertz, lots of news world wide on the B-P-L front, and the FCC talks about license processing. Find out the details on Amateur Radio Newsline report number 1409 coming your way right now.

RESTRUCTURING: AUSTRALIA TO SEEK NEW 500 KHZ HAM BAND

The old 500 kHz the international maritime distress frequency could become part of a new ham band down-under. This if the Wireless Institute of Australia has its way. W-I-A News anchor Graham Kemp, VK4BB, joins us from Brisbane with the details:

--

The WIA will shortly be writing to the ACA to request the establishment of an experimental amateur allocation at 500 kHz. Thats the 600 meter band.

WIA Director Glenn Dunstan VK4DU said "500 kHz was the international maritime Morse code distress frequency for most of the 20th century."

"It was the frequency used by the RMS Titanic to send her plaintive cries for help that April night in 1912. It was the frequency used by thousands of merchant ships to signal their plight in times of peace and war."

"More often than not, 500 kHz was witness to a ship's Radio Officer's last moments. Many Radio Officers literally died at the key as their ship fell victim to enemy action or was overwhelmed by the forces of nature".

Glenn, himself an ex ship's Radio Officer, said. 500 kHz was replaced in 1999 by the Global Maritime Distress and Safety System (GMDSS), which uses a combination of automated terrestrial and satellite communications.

"Since the introduction of the GMDSS in 1999, 500 kHz use has declined rapidly. The last official users of the frequency, China, plan to discontinue operation in 2005. The frequency is no longer used in Australia, New Zealand, the Pacific or the US."

500 kHz has been instrumental in saving tens of thousands of lives in the last 100-odd years. It is thus fitting that the frequency be preserved as a 'spectrum national park' to commemorate those who paid the supreme sacrifice in its use.

"The best way to do this is to establish a small slice of spectrum around 500 kHz - probably 495 to 510 kHz - as an amateur radio band. The band would also provide a unique opportunity for experimentation with antennas, propagation, advanced narrow band modulation techniques and receiver digital signal processing." Glenn said.

--

It should be noted that 500 kHz is still allocated to the maritime service so any permanent amateur access in Australia or elsewhere is some way off. It is worthy of note that the I-A-R-U Region 1 and various United States Amateur long wave groups are actively pursuing an experimental allocation at 500 kHz as well. (WIA News)

**

HAM RADIO IN SPACE: ECHO ON THE AIR

AMSAT has announced that the F-M voice repeater on the Oscar-51 Echo satellite is on for a trial period. The transponder was turned on the 30th July for about three weeks during which command stations will be watching the power budget and adjusting the transmitter power for good management of the battery.

For those wanting to give Echo a try, its uplink is on 145.920 MHz F-M, with 67 Hz CTCSS tone. The downlink is on 435.300 MHz.

A reminder that this is a trial of the F-M voice repeater only. Please do not send any data through it. AMSAT says that the digital portion of Echo is not yet ready for use. (ANS)

**

THE BPL FIGHT: ZS AMATEURS SHOULD REPORT BPL TESTING TO THE SARL

Turning to news on the B-P-L front, South Africa AMSAT President Hans van de Groenendaal, ZS6AKV, has now spoken out. He is urging amateurs and short-wave listeners in that nation to report any unusual but consistent interference to the South African Radio League. This as the rollout of Broadband over Powerline continues in that country.

ZS6AKV says that South African hams must continue to be vigilant about any B-P-L testing taking place in their neighborhoods. Hans says that following Pretoria's example several other metropolitan areas have shown an interest and may soon be starting trials. (SARL)

**

THE BPL FIGHT: FOLLOW-UP ON SAN DIEGO GAS AND ELECTRIC

Back here in the USA, San Diego Gas & Electric has confirmed that it is considering entering the Broadband Over Powerline business, but for now that's about all the utility will say.

As reported last week, San Diego Gas & Electric planners are reported to be seriously considering endorsing and sponsoring Broadband Over

Powerline data transmissions on the company's power distribution system. The story went on to state that San Diego Gas & Electric is also considering entertaining proposals to partner with vendors for one or more field demonstrations of BPL. This, this despite being advised that B-P-L will cause considerable interference.

Bob Gonsett, W6VR, whose CGC Communicator newsletter was first to break the story put in a call to the utility to try and get a bit more information. San Diego Gas & Electric response was brief and far from insightful. All that the utility would tell Bob is -- and we quote: "Like many utilities, San Diego Gas & Electric is assessing B-P-L technologies."

W6VR says that while we are all temporarily left in the dark as to San Diego Gas & Electric plans, those plans will eventually surface. As soon as they do, we will let you know. (CGC)

**

THE BPL FIGHT: NORTH CAROLINA UTILITY ENDING BPL FIELD TRIAL

Meantime, North Carolina's Progress Energy Corporation says it's completed Phase II of its B-P-L field trial in the Raleigh, and will be closing down the experiment. In an August 4th internal memorandum reported by the ARRL Letter, the company said its program to test the viability of providing broadband service to communities it serves will wrap up by the end of August. The company reportedly will shut down the system once it's able to move its BPL customers to other broadband providers. Progress Energy's decision comes on the heels of announced shutdowns of B-P-L field trials in Penn Yan, New York, and Cedar Rapids, Iowa. (ARRL)

RADIO LAW: HAM RADIO EXEMPT FROM CONTROVERSIAL SAN DIEGO WIRELESS SITING ORDINANCE

Wireless communication antennas would be allowed in San Diego, California's residential areas only as a last resort under a new policy recently approved by the City Council. By a vote of 7 to 1, the council has approved a new policy governing the design and placement of wireless antennas, making it more difficult for cellular carriers and others to erect towers in or near residential areas.

Under the new regulations, the process will differ according to location. Some approvals would be made at the staff level, while others would require an okay from a planning group, a hearing officer or the full Planning Commission.

In the past 20 years San Diego has processed over 1,400 applications for cellular telephone towers but the the city has not tracked how many were actually built but there is some good news for hams on this one. ARRL Southwestern Division Vice Director Tuck Miller, NZ6T, reports that amateur radio is specifically exempted from the terms of this new ordinance

More about the ordinance itself is on-line at http://www.signonsandiego.com/uniontrib/20040728/news_1m28wireless.html (CGC with further information from NZ6T)

RESCUE RADIO: COMMISSION SEEKS COMMENTS ON RULE CHANGES FOR EAS

The FCC has issued a Notice of Proposed Rulemaking concerning possible revisions to the Emergency Alert System or E-A-S system. The agency is seeking comment on how E-A-S can become a more effective tool for warning the American public of an emergency. It is also a chance for radio amateurs to suggest new ways that the E-A-S might be interfaced with our hobby to better serve the public in time of need. More information is at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-250534A1.doc (CGC)

**

WITH THE FCC: MANAGING THE DATA PROCESSING OF LICENSES

The FCC has a lot to say about the Universal Licensing System and some of the problems it faces in administering it. Especially those dealing with paper filings from the ham radio community.

Donna Scott, a Program Analyst with the Wireless Telecommunications Bureau in Gettysburg, Pennsylvania. And in a recent interview with Rain, he outlined just one of the most common situations that her office runs into. This one dealing with applicants who faili to provide their FCC Identification Number better known as an F-R-N:

--

Scott: "I believe that one of the biggest problems that we encounter are paper filings coming here to Gettysburg with no F-R-N on the application. The F-R-N is mandatory. This is the registration number that you obtain through the CORES database and without that number wee really can't accept that application. And we do have a high volume of paper applications that still come in without that number."

--

Probably the second highest volume of amateur applications that need to be returned are those from hams who do not read what's right in front of them. These are hams who insist on sending form 605 V-E-C to the agency. This even though the form 605 V-E-C is only for use by those who give the tests and not for the ham in the street filing paperwork with the agency:

--

Scott: "It clearly states that it is a 605 VEC form. It says do not send to the FCC on the top and on the bottom. Yet amateurs continue to send them here to Gettysburg and we cannot accept them."

--

According to Scott, the only version of Form 605 the FCC will accept from the ham community is the one that contains the approval statement from the governments Office of Management and Budget and that carries a current issue date.

This is only a fraction of the information that Donna Scott described about managing the nuts and bolts of the FCC's licensing system. There's lots more with her on this weeks RAIN Report. Its on line right now at www.rainreport.com or on the phone at 847-827-7246. (RAIN)

**

ENFORCEMENT: ELECTRIC UTILITY WARNED AGAIN ABOUT INTERFERENCE TO HAM RADIO

A Tennessee power company has been told that its response to an earlier RFI complaint is inadequate. The FCC's Daryl Duckworth, NN0W, explains:

--

Audio report only. Download the MP3 newscast audio file at www.arnewsline.org

--

The FCC told the utility that the it knows of no powerline noise problem associated in any way with guy wires. (FCC, RAIN)

**

ENFORCEMENT: $3000 FINE FOR UNLICENSED OPERATION

The FCC has issued Donald Donovan Jackson of St. Petersburg, Florida a monetary forfeiture in the amount of $3,000. This, for operating an FM broadcast station on the frequency 102.1 MHz without Commission authorization.

On November 23, 2002, agents from the Tampa Office observed a broadcast station operating on the frequency 102.1 MHz. A search of Commission records revealed no FM radio station licensed to operate on 102.1 MHz in that area. The agents then used direction-finding techniques and determined that the broadcasts originated from a commercial office building located in St. Petersburg. Field strength measurements taken near the sight of the broadcast indicated that the signal strength exceeded the permissible limits for a non-licensed station.

The agents interviewed the owner of the building who provided them with a copy of the lease for suite. He also informed them that a person named Donald Donovan Jackson operated the radio station from the premisis.

On January 15, 2003, agents from the Tampa Office interviewed Jackson and conducted an inspection of the station after again observing a radio station operating on 102.1 MHz. During the interview, Jackson admitted to leasing the property and operating the radio station from that location. He was given the usual 30 days to pay the fine or to file an appeal. (FCC)

**

RADIO LAW: DOJ WANTS MANDATED DIGITAL WIRETAP ABILITY

The Department of Justice says that technology companies should be mandated to ensure that law enforcement agencies can install taps on Internet traffic and new generations of digital communications devices. This as the D-O-J and other agencies press for a digital expansion to the Communications Assistance for Law Enforcement Act.

The Communications Assistance for Law Enforcement Act is a 1994 law that requires the telecommunications industry to build into its products tools that U.S. investigators can use to eavesdrop on conversations with a court order. The investigatory agencys are worried that federal agents would not be able to install court ordered wiretaps against criminals who communicate using the latest digitally encrypted technologies. Lawyers for the Justice Department, FBI and Drug Enforcement Administration say that this need requires immediate attention and resolution by the Federal Communications Commission. (Published news reports)

**

RESCUE RADIO: HAM RADIO AT THE DEMOCRATIC CONVENTION

Eastern Massachusetts ARES was activated to support Public Service

Agencies during the Democratic National Convention which concluded Friday, July 30th. The ARRL reports the Salvation Army, that the American Red Cross, and the Massachusetts Emergency Management Agency all helped out. ARES was ready to provide any needed support in case of catastrophic loss of the communication infrastructure that had been installed for the event. (ARRL)

**

RADIO IN SERVICE: FITTEST SEEKING ASSISTANCE

Those involved with Rescue Radio may find some appeal in this. The United Nations World Food Program's FITTEST operation is currently seeking Telecommunications Specialists for 3 to 6 month contracts.

FITTEST stands for the Fast Internet and Telecoms Emergency Support Team and it offers constant travel, constant pressure, constant challenges in a job that still allows you to combine a family life and a professional life in a two or three months on one month off duty regime.

Typically, FITTEST hires people with non-conventional career paths to provide emergency deployment of VHF and HF networks, Satellite and Telephone systems. They are looking only at people with direct hands-on experience willing to work under harsh circumstances.

To get an idea of the work they do in Iraq and Afghanistan have a look at their web sites. They are in cyberspace at http://www.hiciraq.org/mediacentre/gallery/FITTEST/ http://www.qsl.net/ya5t. Applications to mark.tell@wfp.org and martin.kristensson@wfp.org (WIA News)

ON THE WEB: BIG CHANGES AT THE QRZ.COM WEBSITE

Some major changes are taking place at the very popular QRZ.com ham radio website. We have more in this report:

--

Fred Lloyd, AA7BQ, who runs the QRZ.com website has announced major changes in access to posting access site. This, for registered users whose login user name is not the same as their ham radio callsign.

Basically, Lloyd says that only contributors who have legitimate ham radio calls will be permitted to post material to most areas of the website. To accomplish this Llloyd says that he has created two levels of membership. One called Ham is for those who want to use their call sign as registration login. The other will be the Guest member for those who may not have a call or who simply prefer not to use it.

Those who have a call and use it for login purposes will have full read and write access to all public Q-R-Z forums, plus the ability to make changes and/or additions to listings in the callsign database. Guest level members will be limited to posting on the sites Help Forum, the For Sale Forums, and the Questions and Answers Forum. These people will have no access to callsign database editing functions.

QRZ.com has also instituted several rules to help keep order and decorum at the site to make it enjoyable for the majority of those signing on. Among these are the right to terminate the current and future membership status of any user who engages in the harassment of any other user, staff member, or volunteer of this system or the use of any information derived from the website that contributes in any way to unsolicited e-mail of any kind. Also banned is the posting of obscene or offensive material on the site and QRZ managers say that they reserve the sole right to determine what is either offensive or obscene.

Lloyd says that the site will shortly begin converting current members to the new system. If you are currently signed up using your call sign as your logon I-D you need do nothing. For those who are not, QRZ we will be assigning new login names to those current members who are apparently licensed amateurs. The new logon name will be the same as the callsign that is listed in the QRZ call sign database as the 'Primary Callsign' for that account. Each user who is subjected to a name change will be notified via e-mail at the address we have on file for that user. Names that cannot be associated with a callsign will be assigned to the Guest level of membership.

For the Amateur Radio Newsline, I'm Bruce Tennant, K6PZW, in Los Angeles.

--

Lots more about the changes are on the QRZ.com website under the title QRZ System Announcement. Lloyd and the managers at QRZ say that they hope that these hanges will improve the website for everybody. (QRZ.com)

**

HELPING HAND: THE AUDIO NETWORK

The U-K Audio Network is a website for the blind using audio web pages, controlled by standard keyboard navigation. It is the first site in the world that needs no adaptive technology to be accessible by blind and partially sighted users.

There are many resources on the Audio Network. For example, it is the only place on the Internet where you can listen to BBC Radio schedules for the forthcoming week in audio. And speaking of radio, there is a whole section of radio stations where you can change channels at the touch of a button, without having to worry about annoying pop ups or filling out a registrations.

Best of all this website is free. Its located in cyberspace at http://www.yrguk.com (RSGB)

**

THE SOCIAL SCENE: DENVER IN AUGUST

Turning to the ham radio social scene, the Denver Radio Club Hamfest is scheduled for Sunday, August 22nd at the Jefferson County Fairgrounds in Golden. Doors open at 8:30 AM with door prizes awarded throughout the fest. For more information contact Bryan Steinberg by e-mail to kc0cua@arrl.net or visit the clubs website at www.qsl.net/q0tx (KCØCUA)

**

THE SOCIAL SCENE: CFMC IN ILLINOIS IN SEPTEMBER

And the Chicago F-M Club will hold its annual Hamfest and Flea Market on the weekend of September 18th and 19th. The venue is the Lake County Fairgrounds in the city of Grasyslake, Illinois. More information is on-line at wwwchicagofmclub.org. (E-mail)

**

HAM RADIO IN SPACE: ARISS AT HAM FAIR JAPAN

Amateur Radio on the International Space Station will be represented at the upcoming Ham Fair 2004 on Saturday and Sunday, August 21st and 22nd in Tokyo, Japan. The ARISS U.S. team provided photographs of the radio equipment in the Service Module to J-J-one-L-Y-U. He will display some of them along with a modified Kenwood D 700 E transceiver which looks like the flight radio. Other photos will be used in a slide show as part of an exhibit in the Kenwood Booth. Ham Fair is sponsored by the Japan Amateur Radio League with about 28,000 people is expected at the event. (ARISS)

**

SPACE: NASA APPROVES NEW DESIGN FOR SHUTTLE EXTERNAL TANK FITTING

NASA is moving ahead with plans to redesign a part of the Space Shuttle external fuel tank that investigators believe played a critical role in the Space Shuttle Columbia accident.

The Space Shuttle program will soon begin installing an improved bipod fitting that connects the external fuel tank to the Shuttle during launch. Investigators believe that during Columbia's launch in January 2003, insulating foam from the bipod area fell off the external tank and damaged the left wing of the Space Shuttle. (NASA)

**

WORLDBEAT - BELGIUM: GALILEO GPS SYSTEM APPROVED BY EU

Officials in Brussels, Belgium say the satellite navigation system the European Union is planning will not clash with one already in operation by the United States. This, as an agreement signed in that European nation will make sure that the proposed Galileo system will be compatible with the U-S owned Global Positioning System.

Galileo is slated to begin operation 2008. Together the two systems are expected to become a single world standard for positioning and radio navigation. (ANS)

**

DX

In D-X, keep an ear open for GB6LOG. This is a special events station on the air through August 18th to celebrate the 60th anniversary of the Liberation of Guam during World War 2. The station will operate on all modes. QSL via the RSARS QSL Bureau to receive the special QSL from this station. For further information contact G0SWY by e-mail to G0SWY@aol.com (GB2RS)

And hams on Gibraltar have been granted permission to use the special prefix ZB300 during the month of August. This to celebrate the colony's three hundred years of British sovereignty. If you work ZB300, QSL as directed on the air. (GB2RS)

**

THAT FINAL ITEM: SIGHTLESS UK NEWSREADER TAKES TO THE AIR

And finally this week the story of a U-K ham who has overcome physical disability to become a news anchor for the Radio Society of Great Britains GB2RS News. Jeramy Boot, G4NJH, in Nottingham has the rest of the story:

--

Now news about a new GB2RS newsreader. Annick Morris, M0HDE, of Wigan, Lancashire, became a GB2RS newsreader two when she read the news through the GB3MR repeater. What makes this special is that 18-year old Annick has been blind from birth.

She has a specially-adapted laptop computer which accepts Word files, and which has a single-line display consisting of raiseable dots which form characters in Braille. Annick can read Braille fast enough to read out loud from this, although she can only 'see' one character at a time.

In the future Annick will be newsreading on 6 metres, 2 meters and 70 centimetres and it is hoped that she may also transmit on two bands at once.

Jeramy Boot, G4NJH.

--

This is not the volunteer first job that M0HDE has been successful in. At age 14 Annick attended the "Child of Achievement Awards" in central London after impressing organizers with her determination to overcome obstacles presented by her disability. This award recognizes the efforts of young people under the age of 16 who make special efforts to overcome personal disability or illness while also managing to help others. We at Amateur Radio Newsline welcome Annick Morris, M0HDE, to the worlds ever growing ham radio news reporting teams.

**

NEWSCAST CLOSE

With thanks to Alan Labs, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's W-I-A News, that's all from the Amateur Radio Newsline(tm). Our e-mail address is newsline @arnewsline.org. More information is available at Amateur Radio Newsline's(tm) only official website located at www.arnewsline.org. You can also write to us or support us at Amateur Radio Newsline(tm), P.O. Box 660937, Arcadia, California 91066.

And this note. Because our staff will be in Huntsville to present the Young Ham of ther Year Award there will be no update on the 661-296-2407 line on Friday, August 20th. Phone users are asked to utilize another of the automated phone lines operating in other regions. Our 661-2407 line will update to the latest newscast on Monday, August 23rd.

For now, with Bill Pasternak, WA6ITF, at the editors desk, I'm Jim Damron, N8TMW, and I'm Jeff Clark, K8JAC, saying 73 and we thank you for listening. Amateur Radio Newsline(tm) is Copyright 2004. All rights reserved.

Try 5198 and 5199. Also, you may have to lower the firewall to the medium
setting (ZA Free). I have the same router and this is how I have it set up.

Pretty quick with the name calling,
but short on any useful content.

Now, like I said, how many readers
can get to your store, hmmm? Not
very many. You posted an example
of one store that has one good guy.
That's nice. We've heard from many,
many more, who can't find anyone who
knows diddly.

So, what exactly was your point?
That's what I'm trying to understand.

Thanks, fixed it now, somewhere along the way after correcting my DMZ
IP in the modem I decided echolink needed 8198 and 8199, of course now
I have enabled 5198 and 5199 with the correct DMZ ip, all is working.
I feel rather stupid now!

73s,
Andy.

My brother, circa 1965, was working on a six volt Chevrolet.

His ring got between the battery terminal and ground. (Don't ask me how.)

He ended up with a destroyed ring and a finger with a very painful burn around it.

No permanent damage but come to think about it he's a little weird even today. Hmmm.... but isn't everybody weird but you and me and I sometimes wonder about...

================

This is really not low voltage high current but an event that sticks in my mind as potentially fatal.

I had a female student in one of my community college electronics class. The electronic bench where she was working had a 8 foot strip of outlets on one of the typical 1970s surface mount plug strips. She had plugged in some instrument but in retrospect she hadn't pushed the plug in completely, leaving a small amount of the metal of the plug exposed.

Around her waist she had a silver colored metal belt with a hanging end with a washer shaped end on it. It looked to me like a dog collar.

She bent over the bench to adjust something and the metal end of her belt went across the metal prongs of the plug.

RESULT = lots of sparks, a loud scream, a partially melted end to the belt and a much wiser and more careful student. (And a very relieved instructor, thankful that it hit BOTH prongs and not just one while she was holding touching a grounded instrument case.

Yes, we then moved all the plug strips on the benches where they were mounted to the bottom edge of the bench and removed them from other benches where there were adequate outlets on the plug strip on the front of the shelf along the back of the bench.

Well there was this guy changing batteries on a golf cart.
Had 6 very large 6 volt storage batteries wired in series.
He was using a ratchet wrench to remove the battery contact
clamps and while detaching the most postive end first (!)
the ratchet handle touched the frame of the golf cart.

Ever see a Sears ratchet glowing WHITE HOT?

Though there is considerable voltage involved in the production of the
currents involved, it is the (forces of the magnetic field of the)
current that crushes the coins.

"Charles Brabham" n5pvl@sbcglobal.net shaped the electrons to read:

>Try amateur radio.
>

There are some people who simply can't set up a shack in their house. Whether it is due to physical limitations, landlord/homeowner edicts, equipment costs or simple laziness, Echolink is a good alternative.

No, it's not radio in it's truest or intended form, but it's better than
nothing in the above scenarios.

My dad (the first W3DHJ) told me an almost identical story.

It was in the late 20's. He was working on _his_ dad's Ford utility
truck. (Grandpa owned a dairy in Big Bear, Calif.) Six volts here, too.
The truck was parked in the driveway -- just outside the garage.
When my dad caught his ring between the positive terminal and the truck
frame, my Grandpa picked him up bodily -- ran him over to the rain barrel
at the corner of the garage -- and stuffed my dad's entire left arm (and
much of his upper torso) into the barrel.

(*The worst* thing you could do in a situation like that is try to _pull_ the ring off.)

My dad was a 90-day wonder in WW II. He then spent 25+ years in the U.S. Army Corps of Engineers (we traveled the planet....) Most of his duty assignments were as (Deputy) Post Engineer -- with the added responsibity as Post Safety Officer. I always knew him to be evangelically anal about safety. I'm sure that incident with the old Ford truck had a wee bit to do with it.

I did once work with this sort of power, at a company which was making superconductors. We had to test various samples at high current/low voltage to determine some of the properties, while they were submerged in various liquified gases.

One project involved setting up a two-module 1000 watt DC power
supply. I "wired" them together using copper bar stock 1" by 1/4",
bent to fit the terminals, and plated with silver for lower contact
resistance. The connection to the samples was with 2 ought welding
cable, which was about 1-1/8" in diameter with insulation.

I have also worked with high voltage RF up to 20 kV, but that is
another story.

The general rule is when you are working with KIL-o-amps, KIL-o-volts,
or KIL-o-watts, is to make sure you don't get KILL-ed.

Happy trails,
Gary (net.yogi.bear)

Remember an old article in popular electronic, back from 1960's,

young boy wanted to help his girl nextdoor with a wart on her hand,
bright as he was, he thought he could use the hv from his pops hf rig
to burn off said wart.... well, she let out this scream that almost
broke the sound barrier and he got his butt wacked big time.

The wart did get removed !

In 1982, I was about 20 I guess and working for Dentron Radio as a tech. For no other reason than being careless, as I was normally on high alert when working on the amps, I discharged a fully charged bank of filtercaps in a Clipperton L from the left hand to the right.

I had tunnel vision for a couple seconds, fell to the ground as co-workers rushed to my side. Short of breath and dizzy I began to sweat profusely. I was ill for about a half hour then both arms began to ache as if I had been pummeled with a baseball bat.

I have been zapped a few times since then but never ever will I allow IT to flow across my chest again, that event scared the hell out of me and I was a strapping young lad in good shape. Today the same hit would kill me, I'm sure of it.

This could also explain my devout interest in QRP today!

Tim

This dates thirty years back: I was about ten years old. My father did occasionally charge car batteries in the basement of our house. The output of the charger was short cable with a broken cigarette lighter plug. He did connect the battery to be charged with a pair of jumper cables connected to it.
I was doing something in the room, when there was a big spark and some smoke started to appear. I immediately disconnected the charger from the mains as he explained to us that this was all we had to do to remove all electricity from a device. I then went to search for him to tell him what happened. When we came back the room was full of smoke and all what was left of the jumper cables was some melted plastic. The copper was all gone !

When I graduated from highschool, 1967, I started work for a company called Standard Plastic Products. What we really did was make those plastic and cardboard Barbie cases. These were heat sealed with RF Energy. Lots of it.

The work area had about 50 sealing machines. These units were Class-C RF oscillators and ranged from 25 to 60 KW. Yes, that is Kilo Watts. Each unit had a large ceramic tube that had a base of around 6 - 8 inches in diameter. The larger units had tubes with large heat sink hats which required a chimney to remove the heat. The RF energy was applied to two copper platens that performed the sealing.

My job, along with three other techs, was to keep these machines working. The most common problem with these things was blowing fuses,

dirty coupling capacitor clips, and some pretty spectacular blowouts
on the platens when the material got too thin.

The real problem was that, you had to reach into the units from the
back to get to the fuses or the coupling caps. The units had
power interlocks, so you couldn't activate with the back open
This was suppose to disable all power, remove the plate voltage,
and allow any charge to bleed off. But there were a few units where
the bleeder circuits did not work properly. This usually left a few
thousand volts on the plates of the tubes. You learned real quickly
to grip your adjustable wrench with your cardboard fuse pullers and
short the plate to ground. It was a heck of a blast and after 2 or
3 times, the unit was safe to work on.

Although I never heard of anyone actually comming in contact with
the voltage, because we were always on our toes, but I am sure that
it would have done some damage. I doubt the government would let
them get away with something like that now.

And you want to talk about QRM, these things oscillated around 27 MHz.

I have 2 Saber III UHF Securenet radios with DES-XL installed in them
and working currently, the radios are 8/10. I also have the T3011 BX KVL

Keyloader for the DES-XL so you can change your Securenet "key". I have
a smart charger for the radios and a charger for the KVL. The KVL has a
new battery bought last year I think and the radios have several
batteries bought over the past several years. I also have the
instruction book
for the KVL (something hard to find now days). The radios also have
antennas
with them. I will gladly program 10 channels in them for you for
nothing. I am

still currently using these but will be upgrading them soon to an APCO
25
SmartZone Astro XTS5000 III 800MHz so I am looking to sell these as
a unit only and will not break the set. Please contact me off line for
more
information. Located in zip 350xx. $2000.00 for the entire setup.
Shipped
only in the USA since there are DES-XL boards installed.

That's why FET is known by many to stand for Fire Emitting Transistor ;-)

Not so much your GP FETs, but power MOSFETs, certainly. They do tend
to go 'pop' quite spectacularly.

Although I knew how crowbar protection worked on PSUs I was shown in a
dramatic way when I used a bench PSU to charge a car battery, for what
ever reason the crowbar operated and put a short across the battery,
lots of bright white wire and smoke for a few seconds.
A colleague of mine was a vehicle radio fitter and always wore metal
watch straps, until the day one bridged a battery supply and chassis. He
always wears a leather strap now and takes his watch off before working.
How more of us are not maimed or killed I'm not sure.

Back in the 60's I recall being at a party where everyone had too much
to drink and some YL's car would not start. The 'guys' went out to help
and checked the battery water level. The guy doing the checking could
not see as it was dark and asked for light. He was talking about a
flashlight and a helping hand showed up with a Zippo lighter. The
battery exploded! Very lucky none were killed or blinded.

You should see a 440 RMS working volt 50,000 Joule MOV on a 600 amp
440 line that has received an over voltage spike.

The only thing left are the connecting wires and they are pointed
straight out. They are blinding if you happen to be looking at one
when it blows, or deafening if you are near. They'd put any 12 gauge
shotgun to shame.

These things are about 3 X 4 inches and just shy of an inch thick.
Used across a pair of 1200 VAC 1200A (as I recall) SCRs (Thyristors)

Mid-'80's ICOM R71A for sale. Recently removed from sailboat as I am looking for RX/TX capability and this SSB is RX only. It works. It shows no outward signs of any abuse. It comes with owner's manual and some schematics. No AC power cord.

Since anyone interested in such a machine knows its value, I'll ask that you simply make me an offer that will satisfy both of us.

Of course; polar format is just one way of writing complex numbers.

Sorry. I should have said "not expressed in rectangular form, IME."

Both or more. As Jerry states, these threads are of interest to all
general readers, I copied a couple of posts to the saved folder for
later perusal. So please don't let PB's bad behaviour discourage them.
I only suggest that PB be ignored when he flies off the handle and
starts dissing perfectly good replies because they're not what he
expected or he doesn't understand them. Somehow he manages to generate
huge threads of inanities and then gripe about wasting his time :-)

- YD.

That was me, but I wasn't seriously suggesting they did break down.
Just having a gently sarcastic prod at Reg's lofty, generalised
dismissal of the usefulness of the Chart.

So at last you admit you got it wrong. It's about time. I can see
where you f*cked up, Mike. I eventually got to the bottom of your
elementary reading error in mistaking the relevant equations on P.107
for the simple ones on P.105 (from memory). Anyone can make a dumb-ass
mistake like that, but it takes a *man* to admit it and apologise for
going off so rudely on half-cock.
Jerry: you're reply wasn't correct but that doesn't bother me. You
gave it in good faith and with the best of intentions. There are a lot
of guys here who could learn from you where manners and good faith are
concerned.
G'nite all...

Please Paul, don't flatter yourself. You're the only person whose
ever killfiled me and I wasn't losing any sleep over it.

I changed to Activ8 after someone mispelled it. I thought it was a
more proper way to convey "activate" as opposed to "active 8". I got
tired of looking at it and stuck the "e" back in there.

Active8 - when I throw the switch, it works.

Just the polar conversion part which I recanted long ago - probably
in my second post. I haven't reversed my original statement that the
Z can be read as S directly off the chart *as is* if you measure the
vector and project it to the unit circle. The equations on p 105 are
irrelevant to the original question.

> It's about time. I can see
> where you f*cked up, Mike. I eventually got to the bottom of your

That ain't the case. I was looking at the chart and suggested a
polar conversion, which I later termed a "knee jerk" response.

> Anyone can make a dumb-ass
> mistake like that, but it takes a *man* to admit it and apologise for
> going off so rudely on half-cock.

I slapped you around because you couldn't just accept that the
graphical solution works. Also, you're slow on the uptake (remember
not understanding those colored arcs you posted) and it might just
be possible that serious electronic design (as opposed to twiddling
values in spice) isn't for you. I'm one of those assholes that isn't
satisfied until I can derive the design equations from basic
principles and all that. Despite the work required to aquire that
ability, I keep at it until it's second nature.

```

I've had my ticket for over 10 years, but just never got into things
until recently. Everything I had until now was UHF, but there's so
much more to be heard in 6m, 2m, 220, 900, 1.2ghz, right?

But who wants to end up with 6 mobiles, 4 antennae, blah blah, etc.
So I'm looking for advice. A million years ago Icom made the IC900
and IC901, which could add modules for almost anything (but cost a
fortune, and are impossible to find). Was there progress? Did anyone
else pick up the torch where this left off? What's today's comparable
version?

And why is it that the TM742 from Kenwood can hold 3 modules but there are 6 available? How come my 10 year old Alinco DJ580 can scan AM Airline freq's but thats so uncommon today? I remember a time when amateurs wanted to pack as much as possible into their rigs and do it all, is that no longer the case?

And what do people who know more than I reccomend? I get online and look around, and it seems like used tri-bands are the only option, and Kenwood being the only manufacturer which has one which can listen to more than one band at a time. I have a small car, but there is space equal to the size of the average auto stereo free to install a mobile rig. I would love to be able to load up all the local repeaters, and whatever else I'd want to listen to (fire, ems, 800mhz police, air) - and maybe even program it alphanumerically.

So tell me Gods of amateur radio - does such a model exist? Is it possible to get a small unit that can function as a police scanner, alphadisplay, 6m/2m/144/220/70cm/900/1.2gz tranceiver (or some 3 or 4 band mix)? Or am i destined to search for a larger car, mount 7 pieces in it, and drive a porcupine?

Thanks all, I look forward to hearing back in every capacity. And if you have an old IC900 or IC901 or Kenwood TM742, or any commercial rigs that may work (I've got mainly Motorola Saber stuff now) let me know via email.

Richard

Richard,
Well, I was also 'out' for a while and got back in about 5 years ago...I am not THE expert, but I believe what you ask for does not exist.   There just isn't enough activity (worldwide) on 222 900 & 1296 to attach those bands to an 'all-band' radio.
Now, I don't know you budget...

HOWEVER, look VERY CLOSELY at the Kenwood TM-D700A mobile and the Kenwood TH-F6A hand held. I think these come quite close. There is also the Yeasu VX5R (not 100% sure of number), but its Rx doesn't go as high. There's a Yeasu hand held which has 6M, 2M & 440 Tx - don't remember if it is the VX5 or not.

The two Kenwoods I mention cover close to what you ask for RECEIVE.

The D700 mobile is Tx on 2M & 440, and Rx FM from 108 (AM in air band) to 1300.

The F6 hand held is Tx on 2M 222 & 440. Rx from 0.100 Mhz to 1300 MHz --

AM, FM, Wide-FM, SSB, & CW (some limitations, but pretty much everything you can listen to). Just remember that it is still a handheld and therefore has minimal front end filtering (as is more common for the general coverage Rx).

1296 Tx is rare. The Kenwood TS-2000 has it (and 1-2 others), but the 2000 is a 160 through 2M, (222 Rx) 440 & 1296 all mode. It does have a mobile remote control head.

I don't think there is (hardly) any Ham-commercial equip for 903.
Look for Alinco and Ten-Tec. I'm not familiar with their products.
73,
--

OK folks

What is a standard communications Mobile Master SR-CMA. It has 4 wires and one so239 plug.

Thanks
Bill

Although someone has already discussed the difference between impedance and resistance, they forgot to mention that impedance is not measured with ohmmeters or multimeters. It requires a meter that is specifically designed to measure impedance such as that built into most antenna analyzers.

No, truth is some hams like to flex their electrical theory knowledge muscles when ever they get a chance. Almost like going to the doctors and the doctor saying "Well, you should know that, I will let you read these 4 textbooks and you can find the answer yourself".

I see that a lot with hams. Not all of course but most. When a firm comes to me for financial or taxation advice, I don't give them one of my telephone book style text books and say the answer is in there. Some people's accumulated knowledge is in certain direction and hobbies are just that. My statement to those who took the effort to respond to this gentleman's question by flexing their technical knowledge muscles only to tell the student he is on his own, is , Why bother? Why didn't you just ignore the question and let those who wish to answer it, answer it? Or those who can answer it, answer it? No sense telling us all how quickly and smartly you could answer it only to simply snub us. What is wrong with being an appliance operator? If the FCC gave us our license, then who are you to suggest we do not deserve it? Do you own the bands? GFY,,,,,,

Eric, N7DLV

Thanks for a great posting. I save your message as it may apply to my
Kenwood TS-570 as well.

Nice work!

Dick AA5VU

Amateur Radio Newsline™ Report 1408 August 6, 2004

**

A WORD FROM THE ARNEWSLINE (tm) SUPPORT FUND

The following is not necessarilly for retransmission. I guess you already know that if you are hearing my voice on a closed-circuit advisory it means that Newsline is again facing a financial crisis. Well, you're right.

The solution to the problem really lies with you. Our world-wide all volunteer staff produces these newscasts for you. The all volunteer Young Ham of the Year Committee labors tirelessly each year to select a youngster to receive the Award. Joe Eisenberg, K0NEB, oversees the Newsline sponsored Roy Neal, K6DUE, Amateur Radio Mentoring Project database, doing so at no cost. The list goes on and on.

I too am a volunteer, but I have to be the realist. I'm the accountant who has to look at the bottom line and when it turns red, I have to say -- hold on -- there is no more money to continue. And that's about where we are right now.

So, here's the bottom line. If you want the newscasts to continue. If you want the mentoring program to continue and the Young Ham of the Year Award to continue, we need you to show it now -- right now -- through your financial support of Amateur Radio Newsline.

Remember that Amateur Radio Newsline is a federally chartered 501(C)(3) and California state not-for-profit corporation. This makes your donations tax deductible, whether you're an individual or a club. The address to send them to is the Amateur Radio Newsline Support Fund, Post Office Box 660937, Arcadia California 91066. If you missed the address don't worry. It will be repeated at the end of this week's report.

For now I thank you for listening, for responding and offer you this weeks newscast which follows immediately. (ARNewsline Support Fund)

**

Amateur Radio Newsline report number 1408 with a release date of Friday, August 6th, 2004 to follow in 5-4-3-2-1.

The following is a Q-S-T. The B-P-L battelground expands in California and Texas while a U-K repeater is ordered off the air. Find out the details on Amateur Radio Newsline report number 1408 coming your way right now.

(Billboard Cart Here)

**

THE BPL FIGHT: SAN DIEGO CA. UTILITY REPORTEDLY CONSIDERING BPL

San Diego California could be the next B-P-L battleground. This, as an informed source tells the CGC Communicator broadcast industry newsletter that San Diego Gas & Electric is considering the deployment of Broadband over Power Lines in its service area. Bill Pasternak, WA6ITF, is here with the specifics:

--

According to Gonsett's CGC newsletter, an informed source has told him that San Diego Gas & Electric's communication systems planners met recently and are seriously considering endorsing and sponsoring B-P-L on the unility's power distribution system. The newsletter also says that San Diego Gas & Electric is considering entertaining proposals to partner with vendors for one or more field demonstrations of B-P-L technology.

CGC says that these plans should be of concern to all users of the High Frequeny and low band VHF spectrum. This includes TV Channels 2 through 5 and possibly even Channel 6. The latter because spurious and harmonic energy could reach these higher frequencies.

According to CGC and its unnamed source, San Diego Gas & Electric is aware that deployment of B-P-L in its service arera could cause considerable radio frequency interference. Even so, planners at the utility still appear ready to proceed.

More on this as it develops. I'm Bill Pasternak, WA6ITF, in Los Angeles.

--

Bob Gonsett is known on the ham bands as W6VR. He says that he has a call pending with San Diego Gas & Electric corporate communications department to determine the company's official position on BPL. Bob also says to stay tuned for updates. (CGC)

**

THE BPL FIGHT: A TEXAS TRYOUT

Meantime, Larry Pollack, of the W5YI VEC reports that Central Texas-based Broadband Horizons has launched B-P-L operations in three Texas communities. The pilot projects were launched in mid-June in the towns of Blanco, Burnet and Weimar. According to Mike Steele, Burnet's City Manager, the community has had great success with the initial start-up. He says the city plans to expand B-P-L service it to additional parts of the municipality.   (W5YI VEC)

**

THE BPL FIGHT: A BIG WIN IN PEN YAN NY

Meantime the B-P-L test is over in Pen Yan, New York and it appears as if ham radfio has won this round. This,, with word that the broadband provider that's been testing B-P-L in Penn Yan reportedly plans to "move away" from that technology.

According to the ARRL Letter, the Western New York community of some 5000 residents has been considering various proposals with Data Ventures to offer broadband service. A B-PL trial had been underway in Penn Yan for several months.

The village reportedly would get 10 percent of the generated revenue. Now, according to an article in the July 28th edition of the Finger Lakes Times Online, the provider is now proposing to employ wireless mesh "WiFi" technology instead of BPL and ARRL C-E-O Dave Sumner, K1ZZ, has already congratulated Penn Yan Mayor Douglas Marchionda Jr and DVI for going with wireless broadband instead of B-P-L. (ARRL)

**

THE BPL FIGHT: SPOKANE GOES WIDE AREA WI-FI

Spokane, Washington has also opted for Wi-Fi over B-P-L. This as that city inaugurates a wireless Internet access system covering 100 blocks of downtown Spokane.

The wireless zone uses new technology that allows Internet signals to be transmitted more than a mile. This is far beyond the traditional 200- to 300-foot range of previous Wi-Fi systems.

The Wi-Fi area is divided into a private network for use by the city and an open network for the public. Public users can connect for two hours a day at no charge, and subscription plans are in the works for extended use. One Eighty Networks provided the networking for the project. (Published reports)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world WR6ABD repeater serving Aptos California.

(5 sec pause here)

**

RADIO RULES: NO MORE "GROUP X" CALLSIGNS

The ARRL reports that the FCC is no longer issue 2 by 3 format vanity call signs that begin with the prefixes WC, WR, WK and WT. The Commission has acknowledged that it erroneously granted more than 150 WR and WC prefix 2 by 3 vanity call signs from 1997 through September 2003, when it began rejecting such call sign requests.

In the late 1970s, the FCC announced a new Amateur Service call sign assignment system. It provided four standard call sign groups, designated Group A, B, C and D, delineated by license class and issued sequentially with no backfilling. The FCC's Bill Cross, W3TN, recently told the nation's volunteer examiner coordinators that the FCC also had a "Group X." These included WC or RACES, WR repeater, WK and WT-prefix 2 by 3 format call signs reportedly reserved for special-use licenses.

The FCC stopped issuing repeater call signs in 1983 and ceased renewing RACES licenses in 2000. After the current vanity program began in 1996, several ham clubs sought new and formerly held repeater and RACES-type call signs. When the Universal Licensing System came along in August 1999, however, the FCC encountered some licensing system programming shortcomings, including the anomalous assignments of WC and WR prefix 2 by 3 call signs as acceptable formats.

When the FCC implemented programming corrections that halted the issuance of Group X call signs in September 2003, it did not advise the amateur community. As a result, several amateurs who filed for 2 by 3 WC or WR prefix call signs had their applications dismissed without any explanation beyond saying that the applicant's call sign choice was unavailable. That remains the case. The FCC has not indicated whether it plans to address the WC and WR prefix 2 by 3 call signs it's already issued.

In a related matter, the FCC's new Amateur Radio vanity call sign regulatory fee of $20.80 for the 10-year license term goes into effect Friday, August 6. All applications received at the FCC on or after that date must be accompanied by the new, higher fee. (ARRL)

**

ENFORCEMENT: RIS ORDERS REPEATER OFF THE AIR

A 2 meter repeater in the United Kingdom has been ordered off the air after it was involved in an interference issue. The Leicestershire GB3CF system which operates on 145.600 MHz, was closed down on Sunday the 25th of July following a request by the Radio Investigation Service due to an alleged incident of interference.

Service will be resumed as soon as investigations have been completed. The report did not say if the repeater was causing interference to other operations or if it was being interfered with. (GB2RS)

**

RADIO LAW: FEDERAL COURT RULES AGAINST CALIFORNIA CITY

Meantime, on this side of the Astlantic a big win for radio operations but another major loss for a city in its fight to restrict towers and antennas. Bruce Tennant, K6PZW, reports:

--

The attorney for a Rancho Palos Verdes California antenna owner says that his client won a clear victory against the city. This, following a recent federal district court decision requiring Rancho

Palos Verdes to allow him to operate a broadcasting business from his unoccupied home. The judge also ruled that the plaintiff, James A Kay. Jr., may seek damages and legal costs.

And this is not the first major loss for the city. Earlier this year, the U.S. 9th Circuit Court of Appeals ruled that another Rancho Palos Verdes antenna owner could seek compensatory damages against the city. As previously reported, Mark Abrams, WA6DPB, said he will file a claim for damage to his two way radio business while he and the city fought numerous court battles over the right to regulate commercial radio frequencies.

For the Amateur Radio Newsline, I'm Bruce Tennant, K6PZW, in Los Angeles.

--

Abrams has a 52 foot tall antenna tower in his backyard. The city has appealed the case to the U.S. Supreme Court. The full story is on-line at
http://pvnews.nminews.com/articles/2004/07/26/local_news/news1.txt

**

RADIO LAW: AN ANTENNA FREE ZONE

A real estate developer in Australia has come up with some of the toughest property use restrictions ever dreamed of. W-I-A Newscaster Graham Kemp, VK4BB, joins us with the details:

--

VK2WI have reported on a story that the Albury-Wodonga Development Corporation has set some restrictions on its new 40 block Thurgoona subdivision, near Albury.

Listeners to this WIA National News service through the 146.75 repeater can shed any thoughts of establishing a shack in the backyard, as the corporation has banned the erection of free - standing garages or sheds. One may also forget about erecting any antenna arrays as the corporation has also banned external TV antennas, any TV antennas should be placed under the roof or be internal.

Satellite dishes are also under scrutiny; you can have one, as long as no one can see it!

For the Am ateur Radio Newsline, Im Graham Kemp, VK4BB.

--

With these restrictions in place the potential amateur radio activity, using external antennas, is virtually impossible. (VK2GJH via WIA News)

**

RESCUE RADIO: WX4NHC ACTIVATED FOR HURRICANE ALEX

WX4NHC, the Amateur Radio Station at the National Hurricane Center in Miami was activated on August 3rd. This, in anticipation of the arrival of the first major tropiocal storm of the 2004 hurricane season.

Named Alex, the storm was a catigory one hurricane when the WX4NHC came to life at about 10 a-m Eastern on Tuesday morning. Catigory one means the storm had sustained winds of 75 MPH. It was forecast to strengthen before tracking just off the coast of North Carolina on Tuesday afternoon.

The WX4NHC Group monitored the Hurricane Watch Net on 14.325 Mhz. It also took part in EchoLink and I-R-L-P Skywarn Nets that were operational during the approach and departure of the storm.

WX4NHC has maintained an active Amateur Radio Station at the National Hurricane Center for the past 24 years. Please visit www.wx4nhc.org/WX-form1.html www.voipwx.net for details. (CQ)

**

RADIO LAW: IMPROVING AIRSPACE SAFETY

Garmin, Inc. has been conditionally granted its request to use 978 MHz as an aircraft radio datalink frequency. The idea is to enhance flight safety by enabling aircraft in the same airspace to precisely track each other's movement, reducing the risk of mid-air collisions. Datastreams containing location, velocity, altitude and heading are valuable commodities in the arena of air safety. More is o-line at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-04-1871A1.doc (CCG)

**

ON THE NET: TEENS SET WIFI RECORD

A group of teenage hamss from the Cincinnati area got an ovation at the recent Las Vegas DefCon hacker conference. This, after organizers announced that the winners of this year's Wi-Fi shootout might have broken a world D-X record for ground distance in establishing a 55.1-mile Wi-Fi connection.

Ben Corrado KC8RKO, Andy Meng N8MX, Justin Rigling KC8OIO and Brandon Schamer KG4NVK won the prize for greatest distance achieved for an 802.11b network.

The teens, all 18 and 19 years old achieved the record using an amplifier and homebrewed antennas on both ends. This exceeded last year's distance winner by 20 miles. Then, when they established that record, they turned off their amplifiers and broke the record for an unamplified connection at the same distance.

DefCon, in its 12th year is a gathering of hackers, security professionals and intelligence agents from around the world. The Wi-Fi shootout, held for the second time, is among the most popular contests. Six teams participated but it was ham radio know-how that came in number one. (N0AX)

**

BREAK 2

This is ham radio news for today's radio amateur. From the United States of America, We are the Amateur Radio Newsline with links to the world from our only official website at www.arnewsline.org and being relayed by the volunteer services of the following radio amateur:

(5 sec pause here)

**

NAMES IN THE NEWS: GEORGE DILLON NAMED ASSISTANT CHIEF OF THE FCC ENFORCEMENT BUREAU

Some names in the news. Word that George R. Dillon has been named Assistant Bureau Chief of the Enforcement Bureau. Dillon most recently served as the Bureau's Engineering Advisor, assisting the Bureau Chief on a wide range of public safety, technical and management projects. He also represents the Bureau on the Commission's "Engineering-in-Training" Board, for which he received the Chairman's Special Achievement Award, and was the principal leader of the Knowledge Sharing Program, which permits field engineers and headquarters engineers to exchange information and expertise. He is also a member of the Spectrum Policy Task Force. FCC)

**

NAMES IN THE NEWS: G4IDE NAMED WINNER OF TAPR LIFETIME AWARD

And Tuscon Amateur Packet Radio has presented its Lifetime Achievement Award to Roger Barker G4IDE, of Lincolnshire, in the U-K. Barker was honored for his work over the years in providing quality software for Amateur Radio operators that allows them to operate advanced digital modes without the difficulties once associated with these operations. T-A-P-R says that Baker's UI-View program is the benchmark by which all other A-P-R-S mapping software is compared to.   (VK2TDS)

**

HAM RADIO IN SPACE: NEW U-K HAM TRANSPONDER IN SPACE ANNOUNCED

AMSAT-UK has announced a new amateur band transponder project. One to be launched as part of the European Space Agency's S SETI Express satellite.

The project was announced at the opening of the 2004 AMSAT-UK

Colloquium by Dr. Martin Sweeting, G3YJO. Sweeting expressed his delight that AMSAT-UK has been able to work with the European Space Agency to provide, at very short notice, an S band 2.4ghz transmitter.

The SSETI Express project is believed to be the first ever pan-European student satellite with over 100 students from more than nine different countries working on it. The project is being coordinated and managed buy the Education Office of the European Space Agency. (AMSAT-UK, GB2RS)

**

SPACE SCIENCE: SMALLER ISS PRESENCE ANNOUNCED

NASA and its space partners have approved a scaled-down International Space Station with fewer astronauts and less science. This, so the United States can meet a 2010 deadline for ending shuttle flights.

According to news reports, the space agencies of Russia, Europe, Canada and Japan gave unanimous approval to a NASA plan that means the orbiting platform, now about half completed, will never become the beehive of scientific and commercial research once envisaged. In exchange, NASA will continue with plans to launch research modules owned by its partners, some of them already built.

The agreement means the station will never support long duration crews of seven astronauts, as originally planned. It will however be able to house at least four astronauts starting in 2009.

Phase one of the space-station was put into orbit in 1998. The first astronauts took up residence in 2000. (Published reports)

**

ON THE AIR: OH2B BEACON IS BACK ON THE AIR

Finland's OH2B beacon is back on the air after an absense of two years. OH2B is one of the eighteen stations in the world-wide five-band International Beacon Project network. It has already been heard in the UK on 14.100, 18.110, 21.150, 24.930 and 28. 200 Mhz. (GB2RS)

**

DX

In D-X, word that K4ZLE is returning to Uganda. He plans to operate as 5X2A through the 21st of August. Some effort will be made to operate on the lower H-F bands this year, mostly on CW. Activity is also planned for PSK31. (GB2RS)

And F6EAY is in Kabul, Afghanistan and has been issued the callsign T6RF. At present he is active only on PSK31. QSL as directed on the air. (GB2RS)

Closer to home K-7-B-V reports that he will operate portable VP5 from the Turks and Caicos Islands from August 9th to the 16th. The trip will have focus on 6 and 2 meter WSJT work during the Perseid Meteor shower that peaks around August 12. H-F will, of course, get plenty of attention as well. QSL direct to K7BV. (VHF Reflector)

**

THAT FINAL ITEM: THE BIRDS ARE BACK

And finally this week, have you ever tuned in an owl? Yes, we said an owl. You know, tne find that go hoot in the night. Newsline's Joe Moell K0OV will tell you how.

--

It's been several months since I've advised you of opportunities for hams and scanner fans to help wildlife researchers tracking radio-tagged creatures. You can monitor these signals from your home or car. If you have direction finding gear, you might make a positive sighting. Right now, there's a need for ham help in the Denton and Collin County areas of Texas, where researcher Jennifer Johnston is releasing rehabilitated orphan Great Horned Owls into the wild. Six birds are on the air near 150 MHz as I speak, and more are expected to follow. We're also standing by for the departure of some young Burrowing Owls from their nesting places in Florida. A biologist from the University of South Florida wants know where they will end up. Nobody knows, but maybe you can help find out.

For all the details, including frequencies and ideas for equipping yourself for this project, go to www.homingin.com. That's HomingIn, as one word, homingin.com.

Thanks for your help. From southern California, where Burrowing Owls are raising their young in our own Imperial Valley, this is Joe Moell, K-zero-oscar-victor, for Amateur Radio Newsline.

--

Again that website is www.homingin.com (K0OV, ARNewsline(tm)

**

NEWSCAST CLOSE

With thanks to Alan Labs, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's Q-News, that's all from the Amateur Radio Newsline(tm). Our e-mail address is newsline @arnewsline.org. More information is available at Amateur Radio Newsline's(tm) only official website located at www.arnewsline.org. You can also write to us or support us at Amateur Radio Newsline(tm), P.O. Box 660937, Arcadia, California 91066.

For now, with Bill Pasternak, WA6ITF, at the editors desk, I'm Jim Davis, W2JKD, saying 73 and we thank you for listening." Amateur Radio Newsline(tm) is Copyright 2004. All rights reserved.

Hello,

I am looking for some advice on if the ground system featured below is sufficent or should be upgraded. It consists of:

- 3 ground rods 10' each around the tower (bonded together)
- 2 ground plates (one outside, one in the shack, also bonded together)
- lightning arrestors and/or feedthrough adapters
- tower to mast ground
- interior coax switch (not shown)

I provided some pictures below:

http://www.telusplanet.net/~homac/exteriorground01.JPG

http://www.telusplanet.net/~homac/exteriorground02.JPG

http://www.telusplanet.net/~homac/exteriorground02a.JPG

http://www.telusplanet.net/~homac/exteriorground03.JPG

http://www.telusplanet.net/~homac/exteriorground04.JPG

http://www.telusplanet.net/~homac/interiorground01.JPG

http://www.telusplanet.net/~homac/interiorground02.JPG

I am looking for constructive feedback.....

Thank-you....

Lloyd

I have a unregulated 12.5 volt 15 amp power supply that has a no load voltage of just over 15 volts. It's a very simple power supply with just a heavy transformer 2 diodes and a 100k mfd cap. Is 15 volts too high for a mobile solid state vhf transceiver? What is the maximum safe voltage?

Hi Lloyd. Certainly an extremely professional appearance to the work. Great to see such attention to detail as your station provides. Feedback now.....

Is that nice drainage-rock surrounding the tower base only a couple inches deep? Seems the ground rods lose effectiveness for whatever depth that rock is. Would have been fine to sink them a full 10' even after digging a 1' deep trench and covering with topsoil. Besides gaining addtional effectiveness from the ground, it's the exposure to air that will cause the most need for future ground system maintenance.

Ground rods around the tower are very close together, is there room to add additional ground rods from at least two of the legs at a distance of 10-20' from the tower?

Tower is very close to, but not bonded to the house. Are there metal rain gutters or metal flashing close by? Bonding to them is indicated, if so.

Is that a picture of coax shield grounding design, using the SS hose clamps? Stainless steel is a very poor conductor and works when nothing else will - but a copper or bronze shield-ground would be better. Andrews Wire and I.C.E both make nice ones.

Interior surge protection for wiring is going to be a serious issue, when a tower is that close to the structure. EMI from a direct attachment so close will be a challenge that might indicate 200% sizing of neutral wiring, double-ended surge protection and some very good bonding. Ground Potential Rise will start right at your station's single point ground with a tower so close - therefore perfect bonding including the connection to the AC service ground is essential. In that respect, those attractive looking insulated wires bonding the station equipment to the single point ground may be inadequate. The bonding is the only protection from such close aboard GPR, and individual heavy, wide copper straps could do a much better job than the wiring shown.

All in all, I think the only major defect is the lack of additional ground rods, as when a tower is right next to you, the desired direction for attachment current is away, away, away. Carry it away with a ground field that uses very heavy low impedance conductors and at least two more ground rods. More is better considering where your tower is.

Best regards,

Jack Painter

Looks like a pretty good start. I would add a Polyphaser rotator surge protector to those conductors passing through the terminal block on the ground plate.

Make sure everything in your shack is bonded together, including your computer etc. Add protection to phone lines. etc.

The other poster mentioned more ground rods. That is a good idea, arrange them to direct the current away from your shack.

Have you bonded this ground system to the rest of the house? If not, do so by running a conducter to the utility ground rod. Be careful doing so as there may be a slight potential difference that will go away when bonded. Also check your water supply. Is it mettalic? Then bond it as well.

I don't know what they're doing these days, but the standard auto regulators used to be set somewhere around 14.6 if I recall correctly. The standard long term "float" voltage for a "12V" lead acid is 13.6 to 13.8V.   I believe all current radios are rated for this (13.8) voltage.

While considering this, it seems that "just over 15" may be ok, I'd feel uncomfortable with such a supply. Are you sure of your voltmeter accuracy? If I had to, I would find something to load it down all the time with a few amps to keep the no load from getting too high (during Rx). A variac on the input would be one way to do a little "Pre regulation". Where I'm at the Power company can vary from 115 to 126. They like to run a bit high to allow for "older compressors" or so I was told by a company rep.

John,

OK. My guess is that 16 V won't kill anything, but I'm still not comfortable...perhaps over conservative.

Hello
I am doing some mods on my Sangean ATS-803A but there are some difference
between the my old ATS-803 schematic from 1986 and the radio. I�m intrested
in the part of the PCB with AM-MF and the BFO.
The receiver i also sold as Radio Shack DX-440, Siemens RK-651 and ESKA
DX-33.
I doing sync AM and DRM-mod on the radio and hope someone can help me with a
copy of that part of the radio.

Regards

Kjell Bjornfors

Hi Lloyd,

Looks like a nice installation, although your grounding rods might be placed farther apart, or augmented by some heavy gauge radial wires (depending on your local ground condictivity).

What I did note missing was the mention of 'lightning chokes' wound in the coax lines decending from the tower. These are basic to lightning protection for broadcasting towers, but I've rarely seen them implemented by hams.

The idea of a lightning choke is to add a small amount of inductance to the coax so that if a direct lighting strike happens, the instantaneous current flowing though the outer jacked of the coax into your lightning arresters will at least have some amount of impedance limiting the current magnitude, thus reducing the probability of destruction of both the coax and the the arrester itself.

These chokes are more often than not implemented by winding a dozen or
more turns of coax around a form (say a 4" diameter phenolic tube)
prior to the arrester or spark gap.

Harry C.

Harry, that winding of coax may be useful as an RF choke, but it is most certainly not a lightning choke, and will act more like an air-wound transformer than anything else. Not only is this not specified for any lightning protection systems, it is specifically warned against in many.

Most equipment designed to operate at 13.8 Vdc can be safely operated at 10% above this voltage. Thats a little above 15 volts. However, if you are going to use an un-regulated supply, any voltage spike or surge on the primary, will also show up on the output. The spike could be as high as 20 volts or more. This will be more than enough to damage the equipment even if you "pre-load" the supply.

> Hello All. First let me comment that the lightning mitigation techniques
used are better than many ham installations. That being said, I would
increase the conductor size between the tower legs and the ground rods.
When I saw these, I thought a "fast acting fuse." The amount of current
that the tower can handle cannot be safely terminated to ground with smaller
conductors.

Also, the screw terminals need to be checked periodically because they will
loosen themselve due to "cold flow." Why not repace them with crimp types
and then solder the crimp with a torch as a back up? I am asuming that this
device is covered by something to protect it from rain, etc?

John-WA4JM, Dade City, FL, home to some of the most ferocious lightning
activity in the western hemisphere.

> Jack Painter
> Virginia Beach VA

Jack, while I'm sure that you believe this, I really can't guess where you obtained such IMHO such massive misinformation.

First of all, it is the purpose the the coiled coax to act as an inductor (r.f. choke) because this is how it resists the very rapid di/dt common mode characteristic associated with a lightning hit, thus limiting the peak discharge energy that the following spark-gaps and lightning suppessors must absorb and reducing the overall peak impulse power damage potential.

It's basically a brute-force version of the common computer technique of placing a ferrite torroid around cables to attenuate their common mode impulse transmission/conduction ability. Realize that with sufficiently low SWR, currents through both the inner conductor and outer shield of a coax are equal, summing to zero, hence there is no net electromagnetic field produced. The same is not true for a common mode impulse traversing the transmission line. The bottom line is that only the common mode impulse resulting from a lightning strike will experience the results of the "choke".

I'm not sure why you would believe that a coil of coax would act like a 'transformer' of any type, unless the SWR is truly enormous, a probem in itself. A case in point is that in both proton synchrotrons (typically operating in a swept frequency range of roughly 3-30 Mhz), and in large phased array radars (some of which operate in the UHF range) employ multiple feeder coax transmission lines that are cut the the same electrical length, with the cable lengths in excess of the required physical run length being coiled up somewhere in the system. There is no net significant electrical effect on the cable's transmission characterists in either case.

Prior to completing my degree work at Drexel, I spent 8-years installing and maintaining broadcast transmission systems ranging from 5-Kw to 50-Kw. This included 5 years as chief engineer in one station (WBUD in Trenton, NJ) plus part-time work for WFIL, WCAU, and KYW in Philly. (Additional work in 4 or 5 smaller stations.)

Quite honestly, I can't remember a single one of these that did not protect their very costly antenna installations, transmitters, and on-air reliability without lightning chokes employed in their transmission lines. Still, these broadcasters use equipment that, in general, nothing more sophisticated than your average ham station, but on steroids! True, the average AM broadcasting tower usually exceeds 200-feet, but in an intense lightning storm, a 40-foot ham tower is fully capable of experiencing the same energy lightning hit!

I purchased my first ham receiver, an SX-71 from a ham named Bob Rutkowski (sp?) in Trenton, NJ. A day or so before I picked it up from him he took an evidently direct lightning hit on his 40-some foot crank up tower holding a 2M beam that was attached to his house. He had grounded the outer shield of the RG-8U coax at the based of the tower, but without a lightning choke in the coax, the hit simply vaporized the majority of his RG-8U, his grounding connection, and most of the final tank circuit in his rig in the basement! Not a pretty sight!

Realize that a commercial radio broadcaster has to survive episodes like this without disruption of their operations. Hams don't. Still the emulation of the broadcaster's time proven protection techniques involves only a small additional cost to an otherwise excellent installation.

For more information, see:

Edmund LaPort, "Radio Antenna Engineering", McGraw-Hill Book Company, New York. (My issue carries a 1952 copyright, still it's an 'oldie but a goodie' with many subsequent editions -- and AFAIK is still the bible of the broadcasting industry.)

IIRC, early editions of the ARRL Handbook also described this protection technique (likely pre-1970) in the days when most hams built their own rigs.

Harry C.

p.s., Jack, I'd love to hear a citation where "it is specifically warned against", and why.

Were it me, I'd take a close look at the operating voltage range
specified by the mobile equipment manufacturer and do whatever is
required to stay within that range.

Anyone with the merest knowledge of DC Electrical Fundamentals can go into about any Radio Shack company store and be in a position to tech-slam the employees. Radio Shack has pursued a policy of not hiring electronics people for decades, they have remained to the small extent that they are in the electronic parts, tools, books, and 'test equipment'for image purposes and I have been repeatedly told as much by Radio Shack management.

Radio Shack is a cancer on the ass of all electronics hobbies and all electronics professionals, what few remain.

They should be stripped of their image by persistently and consistently reminding the technically less knowledgeable that "real nerds won't set a foot in there". Radio Shack's death would be a good thing IMO.

Putting MM on the dime would serve a lot of purposes. It would displace the devious FDR, send a signal to the Islamist world, make the currency more attractive, and be a thorn in the ass to the Kennedy Family, to name four good ones.

I don't understand this attitude towards RS at all. If you don't like it, don't buy from them. You now have a zillion alternatives right through the internet.

Then again, you may actually be the type of guy that walks into Best Buy or Circuit City and actually relies on the snot-nosed salesperson knowing all about TVs and giving you advice on which to buy. It's a self-serve world out there now. If you want premium service, you'll have to pay extra for it and buy from a smaller shop in which you can get help. But you'll pay more for it.

Thank-you for the advice to this point. I think I will invest in the rotator cable ground. Not sure what to do about the lightning choke.

I don't mind replacing the antenna/mast if I receive a direct lightning hit, I just dont want to turn be fried to a crisp.....

Lloyd

Hi Harry - well, the web is FULL of massive information, and the old trick of coiling coax for lightning protection is simply not specified any longer. I will look up the sites which warned against it, citing amplification of EMI by such a manuever, and get back to you.

>
> First of all, it is the purpose the the coiled coax to act as an

> power damage potential.

Arrestors AND shield grounding are specified at the TOP and BOTTOM of the towers, and AGAIN at the facility entrance. No coils are shown in modern drawings of lightning protection, and I have and reviewed those of one the largest communication companies in the US.

Realistically, such a coil never had any chance of slowing down a 8us/20us or faster attachment of 100,000,000v or even a fraction of that in the smallest of strikes. Coax can only carry 4,500v before the dialectric breaks down and then your SWR and balanced currents are no longer part of the playing field. At about 5,500v the coax can no longer carry the energy by itself and will arc over to anything nearby. So diverting 99.9% of the energy via a fast acting suppressor and shield grounding is the only hope for coax which does in fact take an attachment. Most times the coax does NOT receive the direct attachment! So after shield grounding and arrestor connection, the coiling isn't necessary in the first place, would do no good, and can most certainly act as an air wound transformer to EMI if "wrapped in a dozen or more turns" as you said. Even one turn. Fortunately, coax is "resonant" (used only as an example for high-velocity and low impedance) to a fairly small portion of the DC and AC component of a direct attachment. Not so to the EMI near field, which any wire regardless of it's velocity or impedance will be subject to inductive coupling of EMI. The coax shield will absorb most of that EMI, and unless it exceeds 4500v (very possible in a 50 percentile strike) will be diverted harmlessly to any nearby shield ground. 12 turns of the coax shield - you do the math as you are an electrical engineering expert here - what's the voltage out from

4000v in? Yikes.

Hmmm... What's that they say in all their ads?
"You have questions? We have answers." Oddly
enough, if your question is even the least bit
technical, their answer is either "I don't know",
or it's bogus.

Every once in a while they screw up and hire folks

who understand electronics. But IME, not too
often. And heir selection is *abysmal* - and
getting worse.

Granted, the hobbyist market is down. But I contend
that RS helped destro it.

(sorry of this posts twice, ISP has newsgroup problems)

Hi Harry - well, the web is FULL of massive information, and the old trick of coiling coax for lightning protection is simply not specified any longer. I will look up the sites which warned against it, citing amplification of EMI by such a manuever, and get back to you.

>
> First of all, it is the purpose the the coiled coax to act as an
> inductor (r.f. choke) because this is how it resists the very rapid

> power damage potential.

Arrestors AND shield grounding are specified at the TOP and BOTTOM of the towers, and AGAIN at the facility entrance. No coils are shown in modern drawings of lightning protection, and I have and reviewed those of one the largest communication companies in the US.

Realistically, such a coil never had any chance of slowing down a 8us/20us or faster attachment of 100,000,000v or even a fraction of that in the smallest of strikes. Coax can only carry 4,500v before the dialectric breaks down and then your SWR and balanced currents are no longer part of the playing field. At about 5,500v the coax can no longer carry the energy by itself and will arc over to anything nearby. So diverting 99.9% of the energy via a fast acting suppressor and shield grounding is the only hope for coax which does in fact take an attachment. Most times the coax does NOT receive the direct attachment! So after shield grounding and arrestor connection, the coiling isn't necessary in the first place, would do no good, and can most certainly act as an air wound transformer to EMI if "wrapped in a dozen or more turns" as you said. Even one turn. Fortunately, coax is "resonant" (used only as an example for high-velocity and low impedance) to a fairly small portion of the DC and AC component of a direct attachment. Not so to the EMI near field, which any wire regardless of it's velocity or impedance will be subject to inductive coupling of EMI. The coax shield will absorb most of that EMI, and unless it exceeds 4500v (very possible in a 50 percentile strike) will be diverted harmlessly to any nearby shield ground. 12 turns of the coax shield - you do the math as you are an electrical engineering expert here - what's the voltage out from 4000v in? Yikes.

You have a great installation - and adding a few ground rods and shield
grounds will top it off. Stay tuned for the looping coax fiasco finale....

Jack

This thread reminds me of a conversation I overheard in a Radio Shack store many years ago.

Salesman, trying to sell customer a Micronta sliderule: "See, if you want to multiply 2 by 2, you put this 1 here on this slider over the 2 down here and move this window thing so this line here is on the 2 over here. Then the answer is down here, see, 2 times 2 equals, hmmm, about 3.95.

Not on Sunday afternoon when the transmitter is down and the boss is screaming
at you and you're trying to explain to the man that you want an XLR plug with
four pins, and not three, and he's telling you that nobody uses XLR plugs any
more.

Could you elaborate on that particular trouble? I'm having a hard time
figuring out how an XLR connector could go bad or what you would need
one to get back up.

Thanks,

Phil

It seems that the longer I leave the power supply on the higher the voltage gets. It's up to 18V and that, I'm sure, is to high to use with out some regulation.

John

Yeah. We've seen this thread before -even heard from the guy with the
website too, IIRC. The place definitely isn't a hobby shop anymore.
Closer to a home electronics specialty shop. It may do that pretty
well, but certainly it DOES suck at its 'old' business.
Chuck

..... STAND BACK! She's gonna Blow!

Any line variations or spikes will charge the caps...load it down some.
It's getting close to the range where a regulator will have enough headroom.

Here's a trick. Figure the INput current on the primary at full load. 1.5
to 2 amps. Get a 18-24 volt transformer with that output current rating.
Hook it up so the secondary is "series AIDING" so you have 120+24 volts on
the primary. This'll give you 1.5-2V. more headroom on the secondary for a
series pass regulator with a 723 & some 2N3055's....
Or just another 15 amp, 3 volt transformer series aiding on the secondary...
Or a REALLY BIG 13 V Zener tossed in the swimming pool.

I do the transformer trick (but series opposing) for my Christmas lights to
prolong the life. And series aiding for that odd basement flourecsent
fixture that won't start in the summer when all the A/C units are chugging
away... 130-135 volts and those 40 watters and they really do a John Camron
(keep-on tickin').

In this case, the XLR connector didn't go bad, the %^$%#@!!! TFT remote
control unit blew up, with a nice hole in the PC board of the horribly
undersized power supply and all sorts of collateral damage.  And one
of the other stations in town had a spare Moseley unit that I was able
to grab, but not the connectors for the thing.

I swear, my contract is going to say "no Sparta consoles, no TFT STLs"
soon.

I liked going to some of the Radio Shacks in San Antonio, TX, back when I was in the Air Farce. Most of the [classified school] instructors seemed to have part-time jobs at them, and that was a group with really serious clue.

In MHO, radio shack should have gone out of business years ago!
I use to know 3 people that worked in different stores.
All of them said basically the same thing. The equipment is nice looking but the

insides are substandard and the parts
(if they have them) are only experimenters quality. I once asked for a replacement
rod type pull up antenna. The guy looked at me and went DUH. Then I said and
motioned, silver antenna, pull up, usually on many radios. He replied, we don't
have anything like that. I went in the back and found a very large choice of 3
types. I brought him one and he said, "oh, is that what you wanted"? I put it back
on the rack because it was the wrong one I needed, of course. DUH!
Where have all the REAL electronic stores gone?? :-(

> ****************************************************
Wow! thats a neat idea. Thanks. Actually the transformer has taps for
105,115 & 125 and I've been using the 125 tap. I just moved it to the 105
tap and got 18V no load and 17.1 with a 2.4 amp brake light bulb load.
Apparantly my line voltage is fluctuating cus I had 18 V with the 125 V tap
but it didn't stay there. If I have to do the series aiding trick I'll use
the 125V tap. Don't have a zener big enough but I think I saw one used that
way on a motorcycle, minus the pool.
Here's a link to a picture of a similar supply. The model number is
different but it looks the same.

But that's my point - why in the world would you rely on the advice of a radio shack employee? Their job is to ring up stuff at the register. They don't know anything about electronics.

That's your fault for not having backup parts in the first place....and
besides - why not just look around yourself. Radio Shacks aren't that big -
ignore the sales guy and just find the plug yourself.

Hello All!!

I don't know if you can/want to help me but I am going into my final
year at university and have chosen a final year project concerning
'diplexing signals in the home'

Could any of you point me in the right direction for research
material??  I want to try to gather as much info as possible before I
start back in October and I would really appreciate any help you guys
could give me!!

Thanks
Nerys

Leaves one wondering about just one thing, Steve. If the RS employees are as stupid as you claim they are, HOW WOULD THEY KNOW?

> Hello,
>
> I am looking for some advice on if the ground system featured below is sufficent or should be upgraded. It consists of:
>
> - 3 ground rods 10' each around the tower (bonded together)

Lightning likes to go straight. Try to have at least one ground rod connected to the tower base at the base; the rod should be directly under the base or as close to touching the base as possible. A 10' ground rod is good if in conductive earth. In sandy Florida, where I tood several hits, it took over a 20' length of ground rod (1/2" steel water pipe) to hit conductive "hard pan". I just washed it in until it hit some solid clay, and then washed it into the clay as far as I could.

> - 2 ground plates (one outside, one in the shack, also bonded together)
> - lightning arrestors and/or feedthrough adapters
> - tower to mast ground - interior coax switch (not shown)

The coax switch should be a grounding switch. Floating elements on an antenna could actally attract a lightning hit. Also, for induced hits (not a direct strike, but with enough voltage to damage equipment due to a nearby strike), the grounding of the antenna lines gives the charge a nice safe path to follow. That's better than letting the current find its own path by arcing somewhere. I like to turn off the AC power to my entire equipment setup when not in use. So, with the power switch on the transceiver and the main "shack" ac power switches off, a lightning surge on the power line can only get me or the equipment when I am actually operating. One last suggestion: put a big (3 or 4' diameter) vertical loop (preferably near the ground) in all tower cables going into the house. (Right over your ground plate might be a good place.) The inductance of the loop, and the fact that lighting likes to ionize paths in a more or less straight lines, will keep the main current surge of a direct hit from entering your house and finding its "home" in your power line or telephone line. I survived operating for many years in the lightning belt of Florida and have the burn marks on my mast to prove it. The only known damage in Florida was some induced power that killed a couple of ICs connected to a printer ribbon cable. That was just from the current going down the tower on the outside side of the wall. Lightning protection is still as much art as science, Lloyd - but what you have done so far should fairly well protect folks in the house. If lightning is going to hit, just let it find a nice safe home - and try not to be operating when it does. HI HI

In Florida, a house one block from us burned to the ground when lightning started a fire in their attic. That couldn't have happened at our house, as the lighting had a 70' tower to hit first, and a 23' ground rod to give the current a safe place to go. We were hit - several times. So, look at your well grounded tower as an asset for true lightning protection - not a liability.

Hi Lloyd,

Of the advice offered, out of the dozen or so comments, only the addition of radials and grounding of peripheral equipment made any sense to your already extensive installation. Adding "more" rods sounds like hail Mary solutions. I would bet almost every house for 10 miles around you survives quite well with one.

Sure, few if any sport towers, but lightning in the vicinity is not so choosy as to miss every house, building, or power pole simply because they are not radio amateurs.

I also note the complete absence of discussion about the Code. All grounds must be bonded (clamped, not screw attachment nor solder/brazed) with a continuous wire (no breaks or splices). I also note some rather bizarre descriptions of how chokes work (and to add that they are not used by Hams is simply ignorance or the choice to illustrate with poor examples).

I would suggest you mine the archives of rec.radio.amateur.antenna for two correspondents: Richard Harrison, KB5WZI for thousands of commercial and amateur tower installations over a career spanning 50 years (you will discover half to two thirds of suggested embellishments are immaterial fluff); and Reg Edwards, G4FGQ for the topic of successful ground rod application (notable in that laying them horizontal is just as good, if not better).

As to your last comment about getting fried. You should examine that illusion and recall that it brings voltage to mind, not current. Voltage comes from two mechanisms common here, impedance and resistance (the lightning strike is considered to be from a constant current generator willing to present any potential necessary to preserve flow). A sharp bend in a conductor is one source of impedance change for the bad - so graceful sweeps are preferred where you want to change direction. I note the irony of discussion where chokes are used to build voltage (power being equal to I�E and current being constant guarantees a build up of power beyond what would have been suffered) to guarantee spark discharge elements firing (I suppose so, but this sounds like Advertising Copy to sell spark discharge elements). Most successful solutions offered here for years and years all have the common goal of burying the lightning stroke's current into the soil as soon as possible without any impedance to its path. If you research the archives for low resistance paths of lightning, you will find out how little total power is suffered in a strike (don't fall for the monster under the bed stories of a gazillion volts at a bajillion amps).

Having read the various post concerning coiling the coax to form a "choke", I recall a technical article from "PolyPhaser.com", the lightning product company. Below is an exerpt from the technical document covering Amateur Radio lightning protection and coiling of coax cable to form a choke.

Quote:
(from www.polyphaser.com website)

Even though the inductive properties of the coax cable appear to be beneficial, and extra inductance can be created by adding a few turns to the coax; don't do it. The added turns can also act like an air wound transformer coupling more energy into the line. Make sure coax lines leaving the tower remain at right angles to the magnetic field surrounding the tower.

Unquote

It is my belief, based on coils and induced energy into the coil, that coiling of the coax will induce an EMF field that can be picked up by the coax, or other cabling, allowing it to enter into the house/shack or, more simplified, follow a path that is not desired, i.e. the coax or rotor cable run to the shack. Grounding of the coax at the top and bottom of the tower, attaching coax lightning protecting products at the base of the tower and running the remaining coax to the shack through buried metal conduit, greatly reduces the chances of lightning strike energy from entering into the cable(s) leading from the tower. Additionally, each leg of the tower, not just one leg, should be grounded through it's own seperate ground rod and each leg ground should be connected to a circular grounding system, around the tower. The tower grounding system should be further connected to a house grounding system surrounding the house with 8 foot grounding rods driven into the ground and connected to the house grounding system (central point grounding). The tower grounding system along with the house grounding system should be connected together. The distance between the tower and the house/shack can be lengthy. Connect the 2 systems together and add additional 8 foot grounding rods every 16 feet along it's path.

Using buired conduit for coax and rotor cable, for example, greatly reduces the chance of EMF fields from flowing along the coax and into the shack. A direct lightning strike to the tower will generate an EMF magnetic field that can be picked up by coax, rotor and coax switch cables then flow into the house and through the equipment and/or wiring. The tower, during a direct strike, radiate a large EMF magnetic field that can be picked up by anything within it's path. The strength of the field reduces by a factor of 1, outlined in the Polyphaser.com technical document.

Just some technical information I've found from lightning protection companies during my search for documentation on tower, antenna, coax and rotor cable installation.

73's,

Mike

> First of all, it is the purpose the the coiled coax to act as an inductor (r.f. choke) because this is how it resists the very rapid di/dt common mode characteristic associated with a lightning hit, thus limiting the peak discharge energy that the following spark-gaps and lightning suppessors must absorb and reducing the overall peak impulse power damage potential.
>
> It's basically a brute-force version of the common computer technique of placing a ferrite torroid around cables to attenuate their common mode impulse transmission/conduction ability. Realize that with sufficiently low SWR, currents through both the inner conductor and outer shield of a coax are equal, summing to zero, hence there is no net electromagnetic field produced. The same is not true for a common mode impulse traversing the transmission line. The bottom line is that only the common mode impulse resulting from a lightning strike will experience the results of the "choke".
>
> I'm not sure why you would believe that a coil of coax would act like a 'transformer' of any type, unless the SWR is truly enormous, a probem in itself. A case in point is that in both proton synchrotrons (typically operating in a swept frequency range of roughly 3-30 Mhz), and in large phased array radars (some of which operate in the UHF range) employ multiple feeder coax transmission lines that are cut the the same electrical length, with the cable lengths in excess of the required physical run length being coiled up somewhere in the system. There is no net significant electrical effect on the cable's transmission characterists in either case.
>
> Prior to completing my degree work at Drexel, I spent 8-years installing and maintaining broadcast transmission systems ranging from 5-Kw to 50-Kw. This included 5 years as chief engineer in one station (WBUD in Trenton, NJ) plus part-time work for WFIL, WCAU, and KYW in Philly. (Additional work in 4 or 5 smaller stations.)
>
> Quite honestly, I can't remember a single one of these that did not protect their very costly antenna installations, transmitters, and on-air reliability without lightning chokes employed in their transmission lines. Still, these broadcasters use equipment that, in general, nothing more sophisticated than your average ham station, but on steroids! True, the average AM broadcasting tower usually exceeds 200-feet, but in an intense lightning storm, a 40-foot ham tower is fully capable of experiencing the same energy lightning hit!
>
> I purchased my first ham receiver, an SX-71 from a ham named Bob Rutkowski (sp?) in Trenton, NJ. A day or so before I picked it up from him he took an evidently direct lightning hit on his 40-some foot crank up tower holding a 2M beam that was attached to his house. He had grounded the outer shield of the RG-8U coax at the based of the tower, but without a lightning choke in the coax, the hit simply vaporized the majority of his RG-8U, his grounding connection, and most of the final tank circuit in his rig in the basement! Not a pretty sight!
>

Because Radio Shack no longer has 4-pin XLRs. They also do not have the
1% resistor assortments that were very handy, or the PZM microphone (which
they have replaced with a higher margin boundary mike that is not as good).
In general the quality of their connectors is marginal at best (and I have
got RCAs from them that were chrome plated and therefore would not take
sold).

The problem is that the parts and connectors market is shrinking, and there
are no longer small parts houses in most towns that cater to the TV repair
business... because there are no longer TV repair businesses. This means
that if you need parts on short notice there is often no other choice.

Imagine if you will a group of design engineers sitting around trying to figure
out how to make equipment more annoying for broadcast folks.  "I know, we can
put the power supply all at the bottom so you have to pull all the channel
strips out to get to it, making it impossible to test under load."  "Great,
and then we can use output capacitors that fail into intermittent shorts
so that the supply has to be loaded to find them!"

I usually kill the "new cell phone" pitch by walking in with mine in open view. Works most of the time! As to shopping, you're better off knowing what you want and need and what they offer before going in. At least most of us are better equipped to do that, than the average person! Usually, the guys at the store I go to, know my electronics background, so they rarely bother me. It's the newbies who don't know, who approach me. It is sad that many are clueless in what they sell. It isn't easy knowing everything. What hurt them, is the motto.. "You have questions, we have answers." Too many take that for granted. The employees I suppose try to help even if they come up with half wit answers. They "should" endeavor to learn what they sell, but they're also made to push the cell phones and such..... They can't be making any commission worth a damned off off a $1.99 part. The other thing is too, that with SMT technology, not many are repairing let alone building/experimenting these days.

I didn't know you'd ever worked at KCSC-FM.

Regulators with failure modes that involve smoking the full-wave
bridge.

Capacitors that explode.

Leaking tantalum capacitors that eat the traces off the boards.

Leaking batteries ditto.

UPS battery chargers adjusted so that the "float" voltage is about 10%
too high, so that the batteries outgas, leak, and die.

Ground-loop city.

A plate capacitor on the ttransmitter's final that turns out to be
a strip of PTFE wrapped around the final tube, above the HV lead,
and which gets punched through about once a month.

A grounding hook with a broken resistor in it. The idea is to
discharge the HV PS capacitors "gently". That's fine, as long as the

resistor maintains continuity and discharge to "safe" levels (0 VDC
for me, TYVM) doesn't take a week.

The zener comment was a joke. Though I have two rectifiers that I think are
200 AMP. they are about 2 inches in diameter with a stud out the bottom on
a 1/4 inch thick plate and braid cable out the tops with a mother lug at the
end. Was in Dad's stuff. Had to keep 'em.

Yes, Line voltage _WILL_ vary.

REMEMBER that your voltmeter is reading the AVERAGE voltage. I think the
17.1 may be enough for a series pass _BUT_ you MUST be aware of the low
point on the ripple on the filter caps. The regulator must be able to
function at the low points with the lowest line voltage you think will
occur.

Why not use the 105 tap??

Reasons not to create a coiled-coax "choke"

http://www.comm-omni.com/polyweb/hamradio5.htm
Even though inductive properties of the coax cable appear to be beneficial, and some extra inductance can be created by adding a few turns to the coax; don' t do it. The added turns can also act like an air wound transformer that can couple more energy into the line. This is just the opposite of the desired effect. Instead, make sure that coax lines leaving the tower remain at right angles to the magnetic field surrounding the tower.

http://www.wrblock.com/Papers/Amatuer_Radio/APARS_P09.htm
Neatness counts - cables (transmission lines, power (ac and dc), speaker, microphone, computer, control) should be cut to length and routed neatly and cleanly between boxes using the most direct practical route. The coiling of excess cable length on the protected side should be avoided since it could act as an air-wound transformer coupling magnetic energy from a nearby lightning strike back into the protected equipment.

http://www.marcspages.co.uk/tech/2100.htm
Some in the RF industry would have seen coils used as static drains. The theory is the coil is high impedance at RF and so looks open circuit, whilst still presenting a short to the DC and draining it to deck. The problem with them is they too can start reacting ('scuse the pun!) with the capacitance present on the system, especially at the lower ends of the band.

24hr ops FULL COVERAGE PROTECTION (no "chokes")
http://users.erols.com/n3rr/lightningprotection/

http://www.alvarion.com/RunTime/Materials/PDFFiles/
Lightning_Protection_White_Paper_March31_R41.pdf
ALVIRON SUBSCRIBER SYSTEMS TOWER LIGHTNING PROTECTION
(no "chokes")

And one major US communications company which drawings and specs are confidential and proprietary information - but they do NOT use any kind of coiled-coax and prohibit same from all systems.

Here's one exception - from an Amplifier and relay company - they

are NOT in the lightning protecton business and this is very
outdated advice, but shown anyway becasue we're honest!

http://www.ameritron.com/ameritron/man/pdf/RCS-4.pdf

We strongly recommend the use of lightning retarding loops
in the coaxial cables near the relay box (see illustration).
Remember that lightning travels through the path of least
resistance. Station ground leads should be solid, large surface
area conductors. Do not use braided or stranded wire for the
ground leads. Avoid sharp bends in the ground leads. Use
multiple ground rods and/or radials to provide the earth
termination.
---
Recommend you ignore this and maintain direct paths - JP

Finally, Richard Clark's mention of "code" is pretty important. Reference
the NEC-70 and NFPA-780 for US installations.

for a multi band multimode rig, take a look at Icom IC706, Yaesu FT 857/897
they do up to 70cm, but don't do 220 AFAIK. I have the FT 857 in my car.
as for FM / AM handies.  the Yaesu VX7 is fun .. 50,144,220,440. (My wife
has one)

The VX7 and the 857 can do AM airband etc etc.

You had grounding hooks with resistors in them? Ours were simply 1/4"
diameter bent aluminum hooks connected to ground with #6 stranded
wire! (At least on the Gates BC-10B and RCA Ampliphase 50-Kw models).

I agree that the newer broadacast transmitters are horrow showd to
repair, but their selling point is that they are much more compact and
inexpensive. Still, putting a resistor in series with the safety
grounding hook? That's insane!

Cheap transmitters allow broadcast operators to buy transmitters for
the cost of one of the older rigs, but repairs of a failed transmitter
can linger into hours or days, unlike minites and seconds of dead air
time with a single transmitter as it was in the past.

Just as an afterthought, I remember one failure when the transmitter
of WBUD in Trenton kicked off while I was on duty. The transmitter
kicked off on a hot summer day, and on restart attempts I saw the

antenna feed current meter pin on each attempt. I was intercepted by the station owner while I was in the process of scrambling to find a large screwdrive and a flat file in our repair shop, who demanded to know why I wasn't inside the transmitter trying to located the problem. I ignored him and ran out into the antenna field, and on the second tower of our 4-tower array found a large, carbonized insect in the lighting gap between the tower and ground. Once found, the problem took no more than 5-seconds to resolve and we were within 15-seconds of that back on the air.

Given that a problem like this COULD have shut the station down for a day or two, the station owner remained pissed that I had ignored him and simply done the job that he was paying me for. Fortunately shortly after this even I received my degree and went to work for Eastman Kodak in far away Rochester, NY.

I suppose that the only reason that I dredge up this ancient history is that this was the expected technical performance of an FCC license holder back in the 1950-1970 era. What is it today?

Harry C.

They don't have them any more.

They do have guys with SBE certifications who basically have the same technical performance, except they spend their time removing viruses from automation control systems....
--scott

I got a Volumax on the bench today too. Unfortunately the T-pad on the input seems to be bad.

I have a UBZ-LH14 that no longer transmits. All it does upon powerup is beep at one second intervals. Channel select, etc. all seem to work.
User manual is useless.

Disclaimer- Kenwood UBZ is not amateur equipment but FRS FM stuff. I was hoping that the beeping was something common to all Kenwood transceivers. This unit is programmable with the same software as amateur Kenwoods, so it likely shares chips, etc.

Anyone run into this before? I already did a reset to factory settings,
no help.

Thanks in advance

Not really. Your store is within
reasonable distance of *what* percentage
of usenet readers?

Yeah, I thought so.

There are three RS within reasonable driving distance of my house. One is at the mall. I hate malls. So that's out.

Of the other two, one has two employees who really try to help, the other has one. None of them really know much about electronics. But they're good people, and they try, and I can always figure out if they have what I need (IOW, I ran out of something and I need it now).

One of these stores used to have a guy who knew something. Presumably the guys in black body suits from RSHQ hauled him off in the middle of the night and shot him. Tell your HP friend to watch his six.

Well, yeah, in 1967 they were an electronics
store in a thriving DIY culture. I loved RS
back then, even though Lafayette was better.
(RS was far more convenient.)

Then we're agreeing. Except that their
ads suggest they *are* there to help by
giving advice.

I never ask them anything, except where
something is when I can't find it. In
which case the answer lately is almost
always, ``We don't carry that any more.''

But lots of other folks believe the ads.

``You want a 5K ohm to 8/4/2 ohm,

I knew that, but every time I measure it it's 120 to123.
I've seen the output fluctuate +20%. I dont think the line is changing that much.
>
> .
>
> Why not use the 105 tap??

> I might use the 105 tap if that alone gets me enough V out. But if I have
to use the series aiding trick to drive the transformer with extra volts it
seems to me that it would be less stressful to the transformer to use all
the primary turns.

Just for the hell of it I put a 1/2 ohm 50 watt resister load on it and it
went from 15.3V no load to 11.5V and the resistor got hot real fast.

Yikes!   I = E / R   11 / .5 = 22 AMPS

22 * 11 = Holy S**T (as in I could hear it straining)

Check this out, in order to understand what is being discussed, here:

Reference: http://www.arrl.org/announce/board-0407/

The ARRL set up a committee to look into digital communications for ARES last year.

Talking to one of the committee members early on, not long after this digital group was assembled, I was told that two or three affluent and powerful members of the committee had already decided the group's final conclusion, to utilize the Winlink 2000 system for ARES HF communications.

The six months or so that the committee "studied and discussed" the matter were a formality, a sham.

I know of three persons who attempted to inject a note of sense into the issue, but all attempts to suggest that anything other than Winlink2000 be used were rejected by the committee, often rudely and in one case the rejection involved name-calling and ridicule of fellow Hams that was entirely uncalled-for.

A note of sense? - As a digital experimentor, I know that finding space anywhere on the Ham bands to operate the new wide digital modes like PACTOR II and PACTOR III without interfering with other Hams is extremely difficult.

A PACTOR III signal is six or seven times as wide as a Packet signal, for example, and fifteen times wider than PSK31. - This proposal calls for dozens and dozens of these stations operating from NWS EOC's around the country - if the committe were being honest about its intentions.

The committee was not being honest about its intentions though, which may explain why repeated attempts to talk sense to this committee failed.

Not being honest? - Take a look at the pdf file describing the committee's plans:
http://winlink.org/Emergency.htm While you are there, do a word-search on the word "future" in the article. - You will find that as often as not, the word 'future" is used in the article to describe the HF links in this system. These "future" links are the ones I mentioned earlier, the ones that knowlegable hams tried to warn the committee as to the impracticality of. - The impossibility of getting that many wide-mode digital stations on the air for any purpose without causing massive interefence of every other ham-related activity on the air.

The thing is, you see, that the cynical members of this committee knew that they could ignore warnings about the chaos that multiple wide-mode digital signals would cause on our bands - because the comittee never intended for this system to use Ham Radio in the first place.

That's right; This is another one of those "Amateur Telephone" scams, where Internet junkies put Amateur Radio traffic on the Internet and call it "Ham Radio" because the data was taken from Hams. They lied about it because they knew that if they told the truth, thier non-ham ideas would be laughed right out of the hobby. Winlink2000 is another one of those "ham radio digital modes" that could not exist or operate without Internet linkages.

Yes, the ARRL actually decided that we as Hams should back up the Internet - by using the Internet. (Duh!)

In other words, these people have no clue whatsoever about emergency communications - but they are going to force their ingorant, anti-ham policies upon the Amateur Radio community anyway - with the help of the ARRL. - The result will be that all Hams will look like idiots, not just the members of this "committee".

What has this got to do with the ARRL's decision to "take over" ARES, it's logo and all of it's operational issues? - It is so they can cram this cynical non-radio solution down the throats of Amateur Radio operators who are really more interested in trying to use Ham Radio.

ARRL: The hobby is "Amateur Radio", not "Amateur Telephone"... Get it?

Take-overs like this are usually motivated by a desire to force something upon people against their will, and this shameful takeover attempt on ARES by the ARRL is no exception.

I call it an "attempt" because ARES members across the country are already up in arms over this ignorant, cynical and destructive crap.

If you know any of the great Hams; The real Hams who pass emergency traffic every day on HF, please send them a copy of this via E-mail. That way, when they have been pushed aside to make room for "Amateur Telephone" operators who do not even use radio, they'll know how it all happened, and why.

It's another attack on the hobby by cynical Internet junkies, aided and abetted by the ARRL, as they did with Packet Radio. We all know how Packet Radio ended up after this treatment... Now the same "wisdom" is being applied to ARES.

Isn't that "special"?

Hey, the ARRL is made up of humans, and is not by any means "all bad"... Why not give the president of the ARRL, Jim Haynie the benefit of the doubt and let the gentleman know how you feel about this matter? His E-mail address is: w5jbp@arrl.org

> Your Freedoms are in jeopardy! RadioShack Corporation has filed an injunction in a Texas Court that has shut down an opinion website, http://www.radioshacksucks.com, in direct violation of the Freedoms of Speech, Expression and Peaceful Assembly, as guaranteed to us by the Constitution of the United States. If other companies learn of this, they will use it against any website that speaks out against that company. This is extremely dangerous, as it will change the face and scope of the Internet.

Usually when I see someone bitching about Radio Shack it's from one of the small brained no-lifers who get their kicks from going to Radio Shack and trying to show off how much more technically intelligent they are than the clerks behind the counter.

Unfortunately, I can't make an assessment of your web site to see if it's of the same ilk, because it appears to be shut down.

Awww.....

Let's all say 'Too F...in Bad" in unison. Doesn't seem like you're getting the internet support you wanted!

If you don't like Radio Shack, why do you go there?   Unless, of course, you like the abuse you think you get, and go just to get more ammo!

Wait, I didn't come here for abuse, I came for an argument! Arguments are two doors down on the right.

Makes sense to me, but I think you're asking Reg, judging by the
number of quote ">" characters.

Oh, your just a boatload of good news from the past :(The TRW here
in this area (valve division) is moving to Asia. The state offered
them money to stay, but it was too late. Mgmt had already issued the
decree.

Hello Larry,

I don't have the answer for this, but I'd bet Ronnie WA4MJF does. We have a lot of packet activity in the area, and he's the "guru" in our parts. Drop him a note at wa4mjf@ARRL.net . Hope that helps!

I'd appreciate that. I'll backchannel you with my email addy. I'd
suggest you obfuscate yours in the future - the posting and reply
address in your news reader. The spam bots mine these groups and
it's gotten quite ugly for some in the recent past.

You might alternately consider posting it to
alt.binaries.schematics.electronic under an appropriately
descriptive title.

Hi Dave,
Thanks for the information. I will drop Ronnie a note and see what he has to say. Where are you located? Also how have you managed to keep packet activity going so well. It is pretty dead here in the Central Illinois area as far as I know. We have looked for other means of message passing even if it is between a few stations and really have not found anything better then packet. This site is at a local hospital and they provide us equipment space and antenna room for free. We also have a UHF repeater at this location. We wanted to use the packet for emergencies where people would be transfered to the hospital. We figured information that was typed and printed on an incomming patient would be better than non-medical people trying to convey via voice.

I have copied Ronnie in on this reply but I will still drop him an e-mail.

Dave thanks again for the information.

Hello Larry,

I'm located just east of Raleigh NC, near a little town named "Zebulon".

> Also how have you managed to keep packet
> activity going so well. It is pretty dead here in the Central Illinois
area
> as far as I know.

Well, we decided to keep all of the nodes up and running, you know...build it and they will come. One thing's for sure...if we take the nodes down and don't maintain/expand the system, they surely won't be able to work the mode, hehhehe.... We demonstrate it at events, ham club meetings, promote it amongst ourselves, etc. Sure, it's not as busy as it once was, but there are actually BBS's coming back online in areas that have been dark for years. We also have expanded and built/installed additional nodes to support SEDAN (SouthEast Digital Association Network), APRS, NET105 access to 20m, etc. There's an active packet DX Cluster in the area as well. With that much stuff one can do, it's helping promote packet radio as more than just BBSing, etc.

You can check out some of stuff online at the club's website at www.TEARA.org, and our packet specific site at http://www.ipass.net/teara/index2.html . At www.TEARA.org , you can also click on the "The Repeaters" link and see pics of some of the node stacks.

> We have looked for other means of message passing even

be
> transfered to the hospital. We figured information that was typed and
> printed on an incomming patient would be better than non-medical people
> trying to convey via voice.

Boy, you're SPOT ON with that one. During Hurricane Fran and Hurricane Floyd's disaster in NC, our node stacks were buzzing around the clock. It's a very effective method of passing traffic when the chips are down. What goes in, is what comes out.

> Dave thanks again for the information.
> 73 Larry WA9VRH

Nice to meet you, Larry. Hope to see ya on packet radio!

73,
Dave WB4IUY

Probably what Reg is talking about is that the 1.0 normalized value in the center of the Smith Chart lies on the purely resistive horizontal line. Thus Z0 = 1.0 + j0 (normalized). Reg is probably saying that the Z0 = 1.0 + j0 assumption is not valid at low frequencies for the average transmission line.

Cecil

I can se a couple problems. Both are mine.   First, I should have written that someone is wrong about Smith Charts being *FROM* use at low frequencies. Second, there was no value in my posting something that was already covered by others.

I sure agree with anyone who points out that Smith Charts shouldnt be used where they arent designed to work. I like smith Charts and thats probably a result of my poor academic education.

Yes, and that is one of their disadvantages. An engineer can arrive at a perfect quantitative solution without an iota of understanding of the real-world qualitative physical processes. I personally am much more interested in a conceptual understanding of the process than I am in the accuracy of the abstract numbers which are the solution. Graphs are a visual aid to conceptual understanding that equations simply cannot match (even with a MENSA level IQ).

Richard Feynman, who had a decent IQ himself, said that he couldn't approach anything analytically unless he managed to get an intuitive feel for the thing first.

The good thing about "gut feel", from an engineering standpoint, is that it's a good sanity check on the equations. My engineers sometimes present me with an analytical result that just feels wrong to me, and it usually - but not always - is. Graphs are also wonderful for

feeling how things work, just as analog meters sometimes are so much
more useful than digital ones.

Smith charts can be used to solve purely lumped-element problems, too.

I wonder if Smith charts have ever been used for analyzing 50/60 Hz
power grids. Their losses are fairly low.

I wouldn't be surprised... I've been told that they locate power line
faults using a reflectometer.

Me too. I think that brains are fundamentally analog computers. I mean, when you shoot a rifle or hit a baseball, all sorts of complex adjustments have to be made for the situation, and they're not done numerically. I've acquired sort of this "analog" feel for electronics that gets me pretty close almost without thinking, close enough to be suspicious of calculations that aren't right. I can usually hit a component value or whatever to within 10% just standing up, which impresses/annoys the youngsters who, frankly, are so impressed by my instant numerical results that they accept them without checking... good thing! This analog instinct is a good complement to the math. It saves a lot of time, too, when you just know something will/can't work before you go to the trouble to prove it.

It must be amazing to be a Fermi or a Feynman who have this sort of intuition, but at astronomically higher levels. Fermi would glance at

complex differential equations and just scribble the solutions on a
blackboard, and his co-workers would spend days confirming his
results.

John

I read in sci.electronics.design that Cecil Moore <w5dxp@hotmail.com>
wrote (in <410d7e1e_6@corp.newsgroups.com>) about 'S - Y Parameter
conversion with Smith Chart', on Sun, 1 Aug 2004:
>Jerry Martes wrote:
>>   I think you are wrong about Smith Charts being limited to use at low
>> frequencies.
>
>Probably what Reg is talking about is that the 1.0 normalized value
>in the center of the Smith Chart lies on the purely resistive horizontal
>line. Thus Z0 = 1.0 + j0 (normalized). Reg is probably saying that the
>Z0 = 1.0 + j0 assumption is not valid at low frequencies for the average
>transmission line.

Cigar, I think. The imaginary term isn't zero, and in fact is dominant,
at low frequencies, and this applies for ANY transmission line that
doesn't have its inductance artificially increased, because:

Zo^2 = (R + jwL)/(G + jwC)

and at low frequencies jwL and G are negligible.

Well, I find it hard to believe that, in a weak moment, I visited the site mentioned below. It is obvious that a great deal of time and effort has gone into this thing, and to what cause? To save our rights? Me thinks not. What rights are we having trampled? You're right to slander RadioShack?   That right is only in your mind. You are most likely a relatively well educated individual with many personal conflicts in his life and I feel deeply for you, but mostly your parents and family members. They most likely put up with your drivvel year after year and detest the site of you.

Why don't we just cut to the chase, and you explain, in a very short sentence or a very, very short paragraph what caused you to create this Radio Shack site that you claim sucks so bad that it has obviously destroyed your life and those of your loved ones? When They haven't harmed you. You are harming them by saying to the world that they suck.

I have enjoyed Radio Shack for many years. I was there when they became RadioShack, and I became a valued customer (I believe that because I still get free catalogs in the mail, not many do anymore 'ya know) to them and grew through the whole gammit of stuff they have added over the years and I must say that when I had a problem with a product, and that was extremely rare, they took care of it. In one case the manager returned my money because it was a last item and he couldn't replace it. A few years later when computers came along if this had happened, they could check all the stores in their system to see who still had it on the shelf and that store would mail it to me at my home. Is that cool? I say "Yea Verily".

I love Radio Shack. This little reply is probably enough to get you to open up KF5DEsucks.com I won't sue you unless you get nasty. All my friends will check in and post there I'm sure they will have comments to make there, they have a lot of freee speech to use 'ya know. I have a friend that can enlist, in moments hundreds of hackers that believe in

not only free speech but free hacking tooo!! Free viruses', free
wurmzs, 'n free other stuff too.

After that you can open up another site, KF5DEreallysucks.com

Or, you can channel your efforts into something productive and usefull
and possibbly profitable for yourself and your suffering family which
will no doubt heal many open wounds.

Butch Magee, KF5DE

With power on or off? If they can do it with the power on, they might
just have a chance of getting BPL to work.

Naah! Why did I say that? May BPL die an early and well deserved death.

A solid power line fault usually causes removal of power
from the section of line exhibiting the fault. However,
automatic reclosure will often clear the fault.

I work mostly in time domain, so I need to convert s-params into
lumped device models, and it would be nice to have some software
(affordable software!) that does that. That's not really "dumbing
down" to me... it's the s-params that are dumb simplifications!

One trick I use is to visually estimate fet input and output
capacitances to see if a device is worth closer inspection. Just run
eyeballs down the S11 angle column and estimate the frequency (in Ghz)
where the angle hits 40 degrees. The reciprocal is Cin in pF. Ditto
S22 for output capacitance.

John

Aug 2004:

>40 degrees ???

It's obviously a mathematical ruse, depending on cos(40) or tan(40) or
something like that (like tan(17.4) = 0.1*pi, nearly). I tried to
reverse-mathematic it, but my brane 'urts. (;-)

I bought a new cord for my Kenwood TS-680S but it came
unassembled  The rig has a 6 hole female socket and with the
power cord came the proper plug but no instructions  where do
the 2 positive and two negative leads go
--
OK!

If you have a Ham Radio related website and are
looking for more exposure for it consider joining
The Ham Radio Banner Exchange Program.

For more information you may visit the link below
http://www.cq-cq.com/bp/index.html?ve7dao

In the few months that www.RadioZone.info had joined
the banner exchange program it had received a nice boost
in traffic.

Now if the original poster, and the author of that website would just shut
off his radios and his computer for a hour or two and walk outside into that
silly world, maybe they'd realize there's more to it than frequencies and
harddrives.

That and thumpers. They also have a way to check a ground rod.
Either TDR, I think. Another neat thing I've heard is put a
mechanical vibrator on a down quy and go down the line listening for
loose hardware.

Hello Wedge;

Position the connector so where the wires enter the connector is facing AWAY from you and the connector snap clip is on the bottom. Look at the bottom row of three pin holes. You will notice that the 2 outside pin holes are ROUND on the outside, and outside of the middle pin hole is an UPSIDE DOWN "U" shape. Connect the two POSITIVE 12VDc wires to the UPPER RIGHT and LOWER RIGHT pins. Connect these two POSITIVE 12VDc wires to a Heavy duty fuse holder. Connect the two NEGATIVE or RETURN 12VDc wires to the UPPER MIDDLE and LOWER MIDDLE pins. Connect these two NEGATIVE 12VDc wires to another Heavy duty fuse holder. The reason for fusing BOTH leads is for safety purposes and to better protect your rig. I tried going to the KENWOOD home page to see if I could find an image of the HF DC connector, but was unsuccessful. So I disconnected the power cord from my own Kenwood HF rig to give you these instructions. I hope this helps.

Surly little prick ain't you? Here you have a barrelful of useful
information but you just have to jump on the replies not to your
liking. Since you griped about them wasting your time I take it you're
a slow reader.

Wow -- above the call of duty Eric -- well done
I was about to look at my Kenwood cable for the connections -- ya beat me to it.

This is a great example of how Hams can help hams on a NG.

So folks -- Disregard the junk and flames that appears on the NG's -- Here is the REAL DEAL

Actually they have significant loss.  It turns out that a t-line with loss
has a complex characteristic impedance, not just resistive, so they have to
match complex Z0 's

Jim

There is a big benefit to someone as ill informed as myself when these
discussions involve guys who are actually informed and present
understandable info for "jump starting" guys like me.
I probably wouldnt have read the posts if I'd started reading only *one*
side, without some kind of contradiction.

Jerry

Well, that was Jim yer replyin' to, but since you're not Paul Burridge, that's perfectly fine and I'm glad you did. It reminds me that back when that big Canusa (not Canusa TM) happened, the poster that goes by Ralph and Diane IIRC wrote a nice piece about the dynamics of power systems, line reactance and all that.

That's a new twist for me. You saying we should slap each other
around some more? ;)

Just to summarize the part that's IMO most relevant to Burridges
learning disability, Chis Bowick, on pp. 105 - 107 of Secrets of RF
Design shows an example of a Z plotted on the Smith chart and he
labels it with the complex number representing a Z load and it's
reflection coefficient, both of which can be read directly off the
chart. He then give conversion equations that can be used to find a
numerical answer.

What bugged me is that it's so easy to errantly think that a rect to
polar conversion on the Z would yield an S param when in fact doing
that just gives you a polar representation of Z, i.e. |Z| = sqrt(R^2
+ X^2) and Z ang = atan(X/Y)

I think I agree with you. The Smith Chart is not frequency dependent. The models regarding RF transmission line impedance do start to break down at "low" frequencies. This has nothing to do with the Smith Chart. You get the same bad answers with analytical method using bad models as you do with a Smith Chart. IOW, Reg was wrong. The Smith Chart is not limited to solving only transmission line problems.

I regard polar numbers as complex, especially if the angle is not zero.

> clearly.

I understand that you don't understand that you can read Y, Z, and S
params directly off the chart. The only time you need the
conversions is if you don't have a vhart.

here's your OP:

"I see in Chris Bowick's book on RF circuit design, he provides 8
quite
long-winded formulas for converting between S and Y parameters and
vice-versa. I'm always prone to making careless errors (particularly
with signs) with these kind of equations, so I was wondering if
there's a simpler, graphical method for conversion using the Smith
Chart. After all, that's what it was devised for - the elimination
of
computational errors in such calculations.
I've tried using the vastly simpler rectangular/polar co-ordinate
conversion formulas, but they don't plot correctly on the Smith
Chart,
it seems.
So, does anyone know of a simple graphical way to do it on the SC?"

So turn to page 106 and notice that an S param is plotted and if the
light and your eyes are good enough, you'll see that the point is

also labeled 2 + j1.5

Now what's with the learning disability?

> If you don't have anything useful to contribute to the
> threads

I just did. Twice. Don't jump my ass just because what you heard is
not what you wanted to hear.

> I start then I'd be grateful if you just kept your views to

Motorola also has a couple ANs on "amplifier" "design" and
"impedance matching". Keywords would be those quoted above and
"Linvill".

Uh, I wrote the code and only implemented some of the derived
classes and it's way more code than that.

Well so? Since you think you know better than everyone else here, perhaps you'd like to tell us how to convert this S-parameter, plotted on the chart as you say as 2+j1.5 to its Y-parameter equivalent without using the conversion formulas shown on P.107? For the avoidance of doubt: show us how you would derive the equivalent Y-parameter for 2+j1.5 by the use of the Chart alone.

>I just did. Twice. Don't jump my ass just because what you heard is

Fine. I'll send you a capacitor for the purpose. 1pF ought to cover it.

Hi all,

After many years running without a hitch our packet node using a MFJ 1270 runniing TheNet Plus 2.08B software met with an untimely death via lightening.

We want to replace this node. I have an additional MFJ 1270 but the person who burned the rom's for us is log dead and gone. Is there node software out now that one can just download to a tnc without having to have a prom burner? If there is will it work with a MFJ 1270?

Thanks for any and all thoughts.

So you replied before I could add to my last post, but...

> Since you think you know better than everyone else here,

I haven't contradicted anything that was said other than that which you've said and no one has bothered to correct me on anything. Are you also delusional? I should however take the opportunity to point out that John Woodgate also mentioned that polar conversion, but he *did* mention that it was for cartesian coords, which doesn't apply to your current quandry.

notice that you alluded to using polar/rect conversions? That works for finding going between admittance (mag, angle) and conductance/suseptance. My head was still in the cartesian plane but I can see why it didn't work for you.

BTW, I think if the data sheet gives Y params, I'd use 'em unless I had another reason to convert to S-Params.

> perhaps you'd like to tell us how to convert this S-parameter, plotted
> on the chart as you say as 2+j1.5

2 + j1.5 is not an S-param it's a Y-param

> to its Y-parameter equivalent

You mean its reflection coefficient. Its magnitude is the length of the line and its angle is, again, the angle. No conversion necessary, it's a graphical solution. That's what you wanted and that's what you got.

> without using the conversion formulas shown on P.107?

Did I say I could? ... Aside from my initial knee jerk polar/rect conversion.

Those eqs look like the were derived from eqs for circles.

> For the
> avoidance of doubt: show us how you would derive the equivalent

You asked for a graphical solution and you got it. Twice or so.

>

No, only that one post and I had to use the term because you've had

enough time to memorize that book word for word and yet you insist
on confusing basic things with statements like:

"S-params are typically denoted in the form x+/-yj whereas the
Y-params are denoted as vector and angular co-ordinates"

Also, the post started with the abrev, "VB", not "bullshit".

>

Well, at least you'll have attached *some* value to it. Do you think
I can use it to reduce the Miller capacitance seen at the base?
Hmmm... "cap", "charge", and "input" in 2 lines. Sounds like an
electronics discussion. I thought you said that wasn't allowed here
in sed.

>
>Well, at least you'll have attached *some* value to it.

No. You misunderstand again. The charge (electrical charge geddit?) is
for *you* to put into it. The bill for my wasted time is in the mail.

Ok. I can see it's not an s-param and the number were discussing
just happens to be a Z in the text, not a Y.

Ok. from now on I'll just say you're out to lunch without bothering
to point out where or why.
>
> So you could have saved a lot of bandwidth and me a lot of valuable
> time

That's the pot calling the kettle black. Aside from the need for
others to repeatedly spell things out for you, you're also the guy
who braged about the record setting flame war you had with some
dude. I don't suppose yuo consider that a waste of bandwidth. Don't
add hypocrisy to your transgressionsl.

> by just simply stating "no it's not possible to perform a summary
> translation between S and Y parameters by mappings on the Smith Chart"

But for the third time, it is. The eqs are for getting a *numerical*
answer. If you have the chart, you just read the conversion off of
it directly. Start with the example on pg 105.

That's three (or so) times I've told you and yet you can't
understand why people tire of your lack of understanding.

> and we could all have got on with our lives.

Didn't know you had one ;) ... couldn't resist.

> Thanks for unnecessarily
> dragging out the discussion yet adding nothing to it

Ok. You're right. I added nothing. It was all bs. You *can't* do it
on the SC and you *must* use the conversion formulas. Happy now?
Bowick and I are both wrong.

I enjoy reading this group, mostly for short sweet questions with short sweet answers. I take the time to sort through all of the questions and all of the responses in a thread because if I can't offer some advice, then maybe I'll learn something. In this case, I feel my time is wasted by both of you because there's nothing I can offer to this purely emotional exchange, and nothing I can learn from what's being offered. I think the majority of the readers probably feel the same.

Can you guys take this to a more private venue please??

Just because s-params are in mag <ang format and not in a + jb . At
least I've never seen tham that way. Furthermore, I know exactly
what PB is referring to, in case you didn't notice the page number
refs.

Yeah. I'm on hold here, so I haven't left yet. Delays.

Which group? I could take out the x-posts ;) I forgot that and fully
realize that some groups aren't used to this stuff. Maybe I should
go there more often. I've found the amature groups to be quite good,
not that sed is bad. Check it out sometime :)

You know nothing whatsoever of the nature of that thread and my input to it. On that particular forum, my input was instrumental in assisting an innocent person to defend his hard-won real-world reputation against malicious allegations made over the Internet. It cost the transgressor half a million pounds in damages, thanks in no small part to my guidance and support in an area of expertise in which I *do* unquestionably excell. I'm not here to dish out advice, I'm here to try to learn something about a subject I'm not fully conversant with.

>it directly. Start with the example on pg 105.

Nope. The example on p.105 is nothing to do with converting between S and Y parameters; it simply demonstrates a graphical method for expressing a normalised load impedance in the form x +/-jy as a reflection coefficient in terms of a magnitude and angle; that's all. And as John W said, how do you tell whether the point referred to on the Chart is actually a Y-parameter at all??

>That's three (or so) times I've told you and yet you can't
>understand why people tire of your lack of understanding.

Some people have a gift for expressing themselves lucidly. Roy's single, concise posting was an example of that craft. You have demonstrated nothing of that calibre.

>> and we could all have got on with our lives.
>
>Didn't know you had one ;) ... couldn't resist.

I do, but it's x years minus 1 day thanks to your obfuscation.

>Ok. You're right. I added nothing. It was all bs. You *can't* do it
>on the SC and you *must* use the conversion formulas. Happy now?
>Bowick and I are both wrong.

I didn't say Bowick was wrong. I never said that Bowick stated it was possible to make the conversion solely by means of the graph. You, OTOH, still say that.

I asked purely for information. It might have been that there are limits
on the values that the various parameters can take, and that example was
outside the limits for an s-parameter.

I noticed that, but I, and doubtless many others, don't have the book.

The Smith Chart has served its purpose.

It was a much-simplified version of earlier, more complicated charts, dating back to the Victorian age used to solve electrical engineering problems involving complex hyperbolic functions.

It applied ONLY to the HF spectrum, serious calculating errors occurr if applied to the LF spectrum and below although few engineers realised this. And still don't.

But it became popular with design engineers immediately following its introduction in the late 1930's when HF broadcasting, TV and Radar, and relatively short, low-loss HF transmission lines became the vogue.

The design and use of HF and VHF lines was much further accelerated during WW2 when all the principal participating nations indulged in vitally-urgent, secret work associated with VHF communications and Radar. The Smith Chart became available just at the right time. It could almost be considered as a war weapon used by all sides.

But it became reduntant just as rapidly on the invention of the scientific pocket calculator. In particular calculators which had hyperbolic functions. The pocket calculator could now, much more easily, with equal facility, undertake transmission line calculations involving the whole of the frequency spectrum from DC upwards.

It is said that, these days, the Smith Chart has eductional value. It allows problems to be visualised. Indeed it does. But there are other just as good educational methods which involve mathematical procedures.

My first association with transmission lines was in 1944/5. I have never used a Smith chart in the whole of my career. Neither have I ever met anyone who has. Perhaps I haven't met many people.

The Smith Chart, as sentimental and as nostalgic as it may be, is redundant.

Reg.

I read in sci.electronics.design that Reg Edwards <g4fgq.regp@ZZZbtinternet.com> wrote (in <cegvp8$gpk$1@hercules.btinternet.com>) about 'S - Y Parameter conversion with Smith Chart', on Sat, 31 Jul 2004:

>It applied ONLY to the HF spectrum, serious calculating errors occurr if
>applied to the LF spectrum and below although few engineers realised
>this. And still don't.

Could you please explain that a bit more? The chart is a graphical way of doing mathematics. Where does frequency enter the picture?

If you mean that the characteristic impedances of 'transmission lines' at low frequencies aren't resistive, I quite agree.

What's the cutoff frequency below which a Smith Chart won't work?

John

g4fgq.regp@ZZZbtinternet.com says...

> It applied ONLY to the HF spectrum, serious calculating errors occurr if
> applied to the LF spectrum and below although few engineers realised this.
> And still don't.

Major employers, especially those with government contracts, require pre-employment drug testing these days. Maybe that's why few engineers think Smith charts somehow become invalid below a certain frequency.
Your mileage, obviously, has varied. :-P

Perhaps Reg can also tell us in which year since the Chart's inception
the mathematical relationship between a graphical solution to a
computation and a numerical one broke down?

*** PLEASE NOTE ***

I am seeing Burridge's crap today only because I'm using my laptop for
news reading, with no plonk filters, since my main "communications"
machine took a dipsy-doodle and I have it lashed up in backup mode
right now.

Without a doubt Burridge is so obscene as to rank him right up there
with the infamous Robert... except that Robert knew his technology.

Poor Burridge never will.

Wot's a VNA ?

I have to agree there are certain aspects, a few octaves of my education,
which have been neglected. The time factor has intervened. But we should
leave personalities out of it.

=================================

The characteristic impedances of ALL practical lines aren't resistive. But your statement just about sums up the situation.

All graphs are redundant and can be replaced by equations or tables.
However, a picture (graph) is still worth a thousand words (or numbers).
A glance at a graph tells me more than an hour of studying endless rows
and columns of numbers.

==

It has never broken down. It's the engineers' educational system which has
broken down. Mathematics gradually became a neglected subject. And that
began around 1945. Students and professors were war casualties. Present
products of the system are mentally handicapped. They are reduced to using
look-up tables and manufacturers' digital-chip catalogues with little
understanding of what's really going on in the world.

It suffices after a fashion but is very poor engineering economics and a
squandering of the Earth's limited resources.

Which is a long way from S-Parameters.

> What's the cutoff frequency below which a Smith Chart won't work?
>
> John
>
==============================

This question shows a limited understanding of the LF, and below, frequency spectrum. There are an infinite number of octaves.

What is the cut-off frequency of a simple R+C high-pass filter?

It is first necessary to specify how many decibels the response must have
fallen.

C'mon Reg, answer the question. What is there about a Smith chart that
makes it incorrect at low frequencies?

Reg

I think you are wrong about Smith Charts being limited to use at low frequencies. Maybe you can take time to tell me where my thinking has gone wrong. I'm not really a good engineer. I avoided the mathematical aspects of design whenever possible.

I considered the Smith Chart a plot of *all* impedances with + R values. That means that there is a point on the Chart that represents every impedance independent of the frequency associated with that impedance determination.

I have maybe been in error when I state that I can look at an impedance plotted on the Smith Chart and identify which combination of the minimum number of reactors will be best for matching that impedance to the impedance of your choice, at any frequency. I realize that there are conditions where my method gets difficult, but, I contend that a Smith Chart is a nifty tool for those of us who arent smart enough to do the math.

Jerry

Damn Reg. So far, I'm really liking what you're writing, history included. As much as I like shortcuts, they never satisfy my desire to truly understand an engineering concept which can only be related (IME and to my satisfaction, etc) via mathematical analysis. If you tell me that a range of resistor values will light up an LED supplied with a certain range of voltage, I'm not going to sleep easily until I know why. Yeah, there are some neat analogies, but that doesn't yield an ohmic value. Math will.

That's why I'm ranting. Running to Wendy's might be a quick fix, but it isn't my way and neither is randomly shoving values into Spice as great of a tool as it is. It's just a tool and it's no better than the operator.

I should stop now because PB already told me to keep my views to myself if they don't answer the question. I should be plonked post haste.

There are other considerations in detemining how to arrange the
matching net. Once you have the topology, the chart is pretty
convenient, IMO. And it doesn't save you from any *complicated*
math. Obviously, going from j5 to j0 is simple arithemtic - you need
-j5 reactance or suseptance depending on whether your selected
topology calls for a series or shunt.

The nice thing IMO is that you can keep track of each step on a
graph of the transformation and not have to look at a blur of
calculations.

IMO, it avoids no arithmetic at all. You still have to add and
subtract. And with or without it, you have to convert the reactances
to puFFs and Henries for that freq.

I have convinced myself that the Smith Chart alows it to be determned if
it is preferable to add series (+ or - X), or Shunt (+ or - X) depending
where the complex Z plots on the Chart.
I really admire the guys who can match impedances with math only. I just
dont have good study habits, so I'm not smart.

Ok. I think I understand your confusion, now, and I hope I didn't call it a Y param (part of the OP subject) and just said it's not an s-param, which as I said, isn't expressed as a complex number, IME.

The example is given as a load of Z = 100 + j75 which normalized to 50 Ohms is 2 + j1.5 and as I've tirelessly tried to drive home can clearly be read off the chart as 0.54 <29.7 deg

Due to the geometry of the SC, a normal polar/rect (v.v.) conversion doesn't work and as I mentioned earlier, those conversion formulas look very much like something that came from the circle equation. If you have a conversion chart handy, look at the (1-y), (1+y) factors and consider the fact that the origin is at 1,1. It's obvious to me that the formulas were derived analytically from

(x-h)^2 + (y-k)^2 = r^2

with h, k = (1,1), i.e., the center of the s-param circle is at the intersection of the unit R and X circles.

Interesting that the +/- signs in the conversion are kin to the hyperbola (no?), which IIRC Reg mentioned (xmission line eqs), but I'll wager it all came from the SC's circular geometry, mainly because I coded an SC chart and went as far as calculating the intersection points where the arc change line width and eventually terminate like a real printed SC, not the typical CAD couple of lines that go to oo . You could say that I have deep carnal knowledge of the chart's construction. My app displays the Z, Y, S params of the cursor position in the status bar and damned if I remember whether I naively (or brainfartedly) used polar/rect conversions for that.

> Wot's a VNA ?

Vector network analyzer. Since the mid-1970s, maybe earlier, they've been able to generate both scalar and polar plots of S-parameters directly. Very handy for antenna work, if you don't mind dragging 75 pounds of gear around! I just wrote some code to grab Smith-chart plots off a friend's Advantest R3762AH, and I'm going through some real hardware envy right now.

> I have to agree there are certain aspects, a few octaves of my education,

True; this thread has been generating more heat than light since it began. I've stayed out of it since I'm not a certified guru at this stuff. I don't want to post any incorrect or incomplete information that will further confuse our esteemed interlocutor. It'd probably be a good idea for all others who aren't fully up to date on the principles to do the same. :)

Conversely, I've already hit 'print' twice on J. Woodgate's posts to keep them around for posterity....

================================

There is nothing whatsoever the matter with the chart. It does no more and no less than what it is intended for.

There is everything the matter with the user - begining with a lack of education!

Reg.

>Reaactance depends on it. I must not understand your question.

Reg wrote that the Smith Chart doesn't work at low frequencies. Since
it's just a way of solving equations, it can't fail to work. What
'fails' is that at low frequencies, either different equations apply
(no) or different terms in the equations become significant (yes).
>>>
>>> If you mean that the characteristic impedances of 'transmission lines'
>>> at low frequencies aren't resistive, I quite agree.
>>> --
>> =================================
>>
>> The characteristic impedances of ALL practical lines aren't resistive.

Well, yes, but at high enough frequencies, the reactive term is small.

Zo^2 = (R + jwL)/(G + jwC)

For high enough w (omega), provided R (series resistance) and G (shunt
loss resistance) are low, Zo^2 = L/C.

> But
>> your statement just about sums up the situation.

You agree with my explanation above, that it's not the chart that
'fails', but that terms in the equations change significance at low
frequencies?

Is it possible that this method of which I have no knowledge could
determine that you need to do this

```
            |
            C| RFC
            C|
            C|
            |
            |    ||         ||
            +----||---+-----||--
            |    ||   |     ||
            |         C|
          |/          C|
         -|           C|
          |>          |
            |
```

when you really need an LP pi for harmonic suppression? Please
elaborate. Sounds like an excellent contribution waiting to happen
to those who are teachable.

> I really admire the guys who can match impedances with math only. I just
> dont have good study habits, so I'm not smart.

Eh? It's not math. It's arithemetic. Give yourself more credit.

Match 50 + j25 to 50 + j0 .... ok you need -j25 which is a series
cap that suppressed no harmonics or a practical shunt inductor that
does. Assume I'm assuming the application I'm assuming ;)

How do you infer the correct topology from the chart only?

--

MMike

I havent learned to type either.

I wrote a short article in Electronic Design magazine in 1966 wherin I outlined a simple way of predicting which combinations of series and shunt reactances would be most appropriate for matching any given impedance. I'd have to re-read it to learn what I wrote. I sure couldnt give any advice about using a Smith Chart from "the top of my head". I've been away from engineering since 1969 when I was layed off from TRW.

The basic thought elaborated on in the article was -- divide the Chart into 8 sections, chosen to identify what combination of reactances are most suited for producing a match. I think that anyone who worked for a short time with impedance matching would find the article unnecessary.

The article included some information on how a Z theta chart can be usefull in analyzing how transmission line transformers effect impedances. I have forgotten everything I ever knew about Z theta Charts.

Cecil says,
> All graphs are redundant and can be replaced by equations or tables.
> However, a picture (graph) is still worth a thousand words (or numbers).
> A glance at a graph tells me more than an hour of studying endless rows
> and columns of numbers.
> --

====================================

Depending on our particular educational history, we all have our separate preferred ways of studying technical situations. And we all usually come to the same correct conclusions.

I too become exhausted by studying endless rows and columns of mere numbers.

Graphs are indeed very useful. But I often find that the form of a mathematical equation provides just as deep an insight into what is really going on in the practical world. Praps I am fortunate at being equally adept at both analytical forms. It must have begun during my school days.

The advantage of equations over graphs is that they are nearer to the quantitative than they are to the qualitative world. They are more precise. And in engineering it is numbers which, ultimately, matter most.

Reg, G4FGQ

I read in sci.electronics.design that Activ8 <reply2group@ndbbm.net>
wrote (in <1qqjyblf14xnh$.dlg@news.individual.net>) about 'S - Y
Parameter conversion with Smith Chart', on Sun, 1 Aug 2004:

>How do you infer the correct topology from the chart only?

You can't. But then the chart doesn't act as a typewriter or Turkish
bath, either. The chart will give you both T and pi solutions. You make
the choice between them on other grounds, such as harmonic suppression.

Thank for the reply
How is impedance to rf measured?

I did take offense(but I'm better now) as I'm rather proud of
aceing the tech exam now.35/35 I didn't pass the cw part so
I'm using Ham University and Koch method to learm the code.
   I checked the FCC page and arrl and they had me down as a
tech. Back when you got your first licence I'll bet the exams
were harder Hell anyone can do the easy ones I think the idea
of relaxing testing was to help a hobby that is dwindleing in
numbers. I'm just starting and I'll continue to ask question
but I check google first I confess in my tagline a line from
Shakespeare I am dim-witted and slow of study managed to get
through medical school with high marks tho'

I'm confused.. I read the article (it didn't have a virus here), and it's
definitely ham related since it deals with echolink....

Do why is this off topic?

Wow. I would be in real trouble here if you guys found out how little I know. I got my General in April 04 and Extra in May 04 and I ain't even been on the air yet. When I get one of my old tube boatanchors ready and an antenna up I'm gonna have to have some notes in front of me when I first try to transmit.

> Thank for the reply
> How is impedance to rf measured?

This may sound like a flip answer but it isn't.

R.F. Impedance is typically measure by the use of an r.f. impedance bridge, or inversely by a r.f. admittance bridge. This equipment is both costly and relatively rare. The General Radio Model 916A is typical of the breed, and has become somewhat of a classic. Here are some examples:

http://www.seed-solutions.com/gregordy/Amateur%20Radio/Experimentation/
RFBridges.htm

You can also estimate impedance through the use of a standing wave meter, after first calibrating it against a known value, non-inductive load.

I don't believe that you can effectively measure the impedance of an un-terminated piece of coax, which can yield some stange, difficult to interpret, length determined measurement results at the driving end.

Harry C.

Hillsborough county sheriff office

district 2 is in the Brandon area district 4
is south hills Gibson and dist 3 is town and country dist 1 is university area
north Tampa
..
The Brandon area is actually in 2 districts. the
Boundary between D2 and D4 is essentially Brandon Blvd
with the exception of a chunk of D2 that extends down
to Lumsden Rd between I-75 and Miller Rd. If you are
listening to the east system the Hotel and Charlie
units (1:00 AM to 1:00 PM) and the Hotel, Charlie, and
Nora units (1:00 PM to 1:00 AM) are D4 units, the rest
are D2. Hillsborough operates on a 2 shift basis with
more units covering smaller beats between 1:00 PM and
1:00 AM.   08-041 is USF campus public safety ch 1,
08-042 is tac 2, 08-043 is tac 3

-----

bayflite

They do use 155.3400, 853.3875 & 123.05 as well as the pinellas 800Mhz systems
..150.860 (pl I think is 192.8) in northern counties
Repeater in Dade City with pretty good wide area
coverage

BCI LTR

It looks like 2 of the frequencies I had were for a different system, so
here's an update:

1. 452.875
2. 451.975
3. 451.725
4.
5.
6.
7.
8. 452.975
9.
10. 451.925
11.
12.
13. 452.275
14. 452.225
15.
16. 451.850
17.
18. 452.400

There were 1-2 times today I noticed that when a talk group tried to use LCN
#10, the other party was unable to copy.

> I can also hear the LTR bursts, but the signal strength is weaker than
> it was when I first found that frequency. Now, anytime a talk group
> tried to use LCN #10, 451.95 no longer works.
>
> Is this system simulcast ? Maybe users in Tampa can hear it just
> fine, but it doesn't seem to be working here in Pinellas anymore.---

KEWEENAW PENINSULA ON THE AIR!

SEPTEMBER 5, 2004

Matt, KB8KNM and Dan, KB8UYZ will activate the rare grid EN67, from Michigan's Keweenaw Peninsula. And for the county hunters, that's Keweenaw County. Listen for K8C on 80 through 2 meters SSB. QSL direct via Dan, KB8UYZ. All QSL's will be answered. A S.A.S.E. is appreciated, but not required.

Icom AT-130 HF Automatic Antenna Tuner, volledig nieuw nog in de doos.
Weg wegens miskoop, helaas. Omgeving Antwerpen. Het winnende bod kan
het toestel bij ons komen afhalen of we kunnen het versturen.

Verkoop, vragen, reactie enkel via eBay:
http://cgi.benl.ebay.be/ws/eBayISAPI.dll?ViewItem&item=8121603807

Hier volgt wat informatie, gevonden op internet, over dit toestel:

Tune in your HF marine world

Suitable for many vessels

The versatile AT-130 can be used with a variety of vessels, even smaller boats that cannot use a long antenna element. For example, the AT-130 will match a 7 m (23 feet) long wire antenna across the marine band in the 1.6 - 27.5 MHz range.

Automatic tuning

No manual tuning is needed. Just push the [TUNE] switch on an Icom HF marine transceiver; the AT-130 adjusts the antenna and the transceiver to the minimum SWR in any frequency on an HF marine band. The AT-130 allows you to transmit with strong RF output power, and is perfect for maritime mobile operations.

Weather resistant

The AT-130 is housed in a durable, completely weather-resistant acrylic case with rubber gaskets. This allows it to be conveniently installed near the antenna element base.

For Icom HF marine transceivers

Icom's sophisticated AT-130 easily matches Icom HF marine transceivers. The AT-130 easily interconnects with an Icom HF marine transceiver. AT-130 installation is simple. No adjustments are necessary. Just connect the control cable and antenna wire and go!

Quick tune-up

Improved tuning performance...the tune-up time is less than 3 seconds in any frequency on an HF marine band. In addition, the AT-130 has 8 convenient memories to store tuning information. Retuning for a memorized frequency takes about 1.5 seconds. This allows you quick trouble-free frequency changes.

Low power tune-up

The AT-130 emits very little output power (just 300 mW) during the tuning process. This reduces the possibility of causing interference to other stations using the frequency.

Specifications

Dimensions: 230(W) x 340(H) x 80(D) mm; 9.1(W) x 13.4(H) x 3.1(D) in (projections not included)
Weight: 2.7 kg; 6.0 lb
Usable Temperature Range: -30�C ~ +60�C
Rated Voltage: 13.6 V DC +/-15% (negative ground) (supplied from an Icom HF marine transceiver)
Current Drain (at 13.6 V DC): 2 A
Frequency Coverage: 1.6~30 MHz (with the antenna length 7 m (23 ft) or longer)
Input Impedance: 50 ohms (unbalanced)

Max. Input Power: 150 W (PEP)
Input Power During Tuning: 10 W
Auto Tuning Time: 1.5 sec. (returning for a memorized frequency), typically 2~3 sec. (when operating band has been changed)
Auto Tuning Accuracy: VSWR 2.0:1
Insertion Loss: 0.5 dB (with a 50 ohms

Thank you for taking the time to read this.

Your Freedoms are in jeopardy! RadioShack Corporation has filed an injunction in a Texas Court that has shut down an opinion website, http://www.radioshacksucks.com, in direct violation of the Freedoms of Speech, Expression and Peaceful Assembly, as guaranteed to us by the Constitution of the United States. If other companies learn of this, they will use it against any website that speaks out against that company. This is extremely dangerous, as it will change the face and scope of the Internet.

If Big Business continues to dominate our lifestyles, we will lose our freedom to worship as we see fit. We will lose our freedom to vote for the candidate that we think will do the better job. We will lose our freedom of the press to accurately report on current events. We will lose everything we have fought and died for in the past 228 years Do not tell this to the descendants of those that have bravely fought in previous battles and wars, for their ancestors would have died in vain. The Constitution will have been overruled by Big Business.

RadioShack is on a vicious witch hunt and will not stop until they dominate our lives. RadioShack must be stopped now, before it gets any later or any worse.

Here is what you can do to help: copy this letter and add your signature to the bottom. Mail it to the following people:

Leonard H Roberts
CEO RadioShack Corporation
100 Throckmorton Plaza
Ft Worth, TX 76102

The Honorable Kenneth Curry
401 W BELKNAP
153RD DISTRICT COURT
FORT WORTH, TX, 76196-0225

Thank you for your help and support.

Radioshack wants to dominate my life?  First I'd heard of it.

Get a grip on reality!

What's wrong with Radio Shack, anyway? I bought something there both yesterday and today. Had what I wanted a cheap enough. No problems.

Anybody can sue anybody. Why should this upset anybody. That's the American way. Sue enough people and you might even become a politician......maybe even a presidential or vice-presidential candidate. My freedoms are certainly not in jeopardy because RS sues somebody....quite the opposite. This just shows what freedoms we have.

RadioShack Corporation has filed an injunction in a Texas Court that has shut down an opinion website, http://www.radioshacksucks.com, in direct violation of the Freedoms of Speech, Expression and Peaceful Assembly, as guaranteed to us by the Constitution of the United States. If other companies learn of this, they will use it against any website that speaks out against that company. This is extremely dangerous, as it will change the face and scope of the Internet.

(from alt.tasteless:)

"...you'll feel a slight pressure"

Saddam needs a urologist:

http://www.cnn.com/2004/WORLD/meast/07/29/saddam.ap/index.html

"Deposed Iraqi dictator Saddam Hussein suffers from a chronic prostate infection and has refused to have a biopsy to rule out any chance he has cancer, an Iraqi official said in an interview Thursday on Al-Jazeera television."

--------- cut -------

Uhhhh, gee ... why would Saddam possibly object to a prostate biopsy if he's having problems? Wouldn't *you* want a prostate exam from a coalition forces doctor? Hey, I wonder if Lynndie England is available with her big industrial rubber gloves?

Keith

Hi guys,

I see in Chris Bowick's book on RF circuit design, he provides 8 quite long-winded formulas for converting between S and Y parameters and vice-versa. I'm always prone to making careless errors (particularly with signs) with these kind of equations, so I was wondering if there's a simpler, graphical method for conversion using the Smith Chart. After all, that's what it was devised for - the elimination of computational errors in such calculations.
I've tried using the vastly simpler rectangular/polar co-ordinate conversion formulas, but they don't plot correctly on the Smith Chart, it seems.
So, does anyone know of a simple graphical way to do it on the SC?

Thanks,

p.

Amateur Radio Newsline™ Report 1407 July 30, 2004

Amateur Radio Newsline report number 1407 with a release date of Friday, July 30, 2004 to follow in 5-4-3-2-1.

The following is a Q-S-T. The ham bands get clobbered by the sun and some of the results are amazing. Find out the details on Amateur Radio Newsline report number 1407 coming your way right now.

(Billboard Cart Here)

**

ON THE AIR: GEOMAGNETIC STORM AND HAM RADIO

A huge geomagnetic storm has hit the Earth, wiping out a lot of High Frequency communications. At the same time its making the VHF and UHF bands a veritable D-X playground. Bill Pasternak, WA6ITF, has more:

--

According to a propagation bulletin issued on July 25th by CQ Magazine's Tomas Hood, NW7US, the estimated planetary K index reached a level of 8, with the Bolder, Colorado K reading a level 7. Translated into everyday talk, that's one heck of a solar storm and it does odd things to radio communications. All you need do is turn on a 6 or 2 meter CW or SSB radio to hear it for yourself.

Solar storms bring with them an increase in Aurora and Aurora based communications. Reports over the VHF Reflector say that this one was no exception. According to Dave Wenner, K3KEL, in Benton, Pennsylvania, his 150 watts to a homebrew 9 element Quagi antenna made it possible for him to make dozens of 144 Mhz contacts. These ranged from Maine across to Missouri plus Nova Scotia, Quebec, and Ontario Canada. Dave's posting said that he did not work any stations to the South but that they were there. He says that he heard K4QI in North Carolina's grid FM06 very strong toward the end of the session.

Wenner's was typical of the reports posted to the VHF Reflector. Many of them said that this was the best Aurora session heard in years.

For the Amateur Radio Newsline, I'm Bill Pasternak, WA6ITF, in Los Angeles.

--

How long does a solar storm like this last? NW7US reports that as Saturday, July 25th progressed, the geomagnetic field again became highly active and reached storm levels. He says that it has continued to get more intense, reaching very high storm levels. As the week progressed more Aurora contacts were reported world -wide with some on the 222 Mhz band and above. (NW7US via VHF Reflector)

**

PROPAGATION: IS THE SUN HARMING EARTH

Meantime the CGC Communicator cites an interesting propagation report. One that says Greenland's ice cores indicate that the sun is more active now than it has been at anytime in the past 1,000 years.

That report also says this has caused a warming trend here on Earth. As a result of this and other solar observations the pseudo-science doomsayers have been quick to jump on the gloom and doom bandwagon. They are out there predicting dyer consequences for those of us living here on the surface of our home planet Earth. But is any of this based on reality? That's what RAIN's Hap Holly asked CQ's Thomas Hood, NW7US:

--

Audio report only. Hear it in the MP3 version of this newscast downloadable at http://www.arnewsline.org/quincy

--

Hood says that you should enjoy the radio talk about the phenomena but not to take it seriously. (CGC, RAIN)

**

ON THE AIR: THOMAS HOOD ON RAIN

By the way, you can learn a lot more about radio propagation and the effects of solar radiation on communications from Thomas Hood on this weeks RAIN Report. Its available right now on-line at www.rainreport.com or on the phone at 847-827-7246. You can read the article referred to by the CGC Communicator at http://news.bbc.co.uk/2/hi/science/nature/3869753.stm (CGC, RAIN)

**

VHF AND ABOVE: ARRL MULLS CVHF/UHF CONTEST RULES CHANGES

ARRL Director Tom Frenaye, K1KI, has also posted some interesting information to the VHF Reflector. He says that says that the work done by the VHF-UHF Contests/Awards Subcommittee has been completed.   That the written report and along with some in-person additional comments were given during the ARRL Board's Program & Services Committee meeting on July 15th. That's just before the ARRL Board meeting that began on July 16th.

Frenaye says that the Program & Services Committee did not take action on the report and will study it during the next several weeks.   In the mean time, the committee agreed with him that the report should be posted to the VHF reflector public consumption. It will also be sent to the Contest Advisory Committee for information and possible comment.

What will happen from here?   Frenaye says that the Program & Services Committee will work with the Membership Services Department in Newington to take the recommendations any further. He says that some rules may changes and some may not.   Except for possible changes to the 2004 E-M-E contest, K1KI does not believe you'll see any major contest VHF changes until 2005. He also notes that some recommendations may have to wait until budget resources are made available. The full ARRL Board does not normally get directly involved in contest rules issues as contest rules are usually not policy matters. (K1KI via the VHF Reflector)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the K8KZO repeater serving Portage Michigan.

(5 sec pause here)

**

HAM RADIO IN SPACE: ECHO ON THE AIR

I'm Bruce Tennant, K6PZW, with some breaking news that hams worldwide have been waiting to hear. This, as AMSAT announces that its new Echo satellite, now renamed AO-51 will be turned on for general use in FM repeat mode on July 30th at about 02:15 UTC.

Echo will be on for a trial period of about three weeks. During that time command stations will be watching the power budget and adjusting the UHF transmitter output as needed for management of the battery supply. Initially, the transmitter will be running at about 1 watt but if all goes well it will be slowly increased during the trial period.

Echo's uplink is 145.920 MHz using FM voice with 67 Hz PL tone (CTCSS) required. The downlink is on 435.300 Mhz, also FM voice. And like many terrestrial repeaters the downlink transmitter will only come on when it hears an uplink signal with a 67 Hz PL tone for about 1 second. After the uplink signals drop away the downlink transmitter stays on for 10 seconds.   After that, the downlink signal goes away. You might say that the operation is just like a terrestrial FM repeater with a 1 second kerchunk filter and a 10 second hang time. The only difference is that this one is circleing the Earth in space.

Norm. (AMSAT)

**

RESCUE RADIO: UK FIRE EVACUATION BRINGS OUT HAM RADIO

RAYNET, the United Kingdoms version of RACES was recently called out during a very hazardous materials fire. Jeramy Boot, G4NJH, has the details:

--

On Monday the 5th of July at 19.55 BST Lancashire Emergency Planning called-out Rossendale Raynet to attend a Rest Centre in Colne. A fire at a building that contained an acetylene cylinder meant that local residents had to be evacuated.

About 40 people went to the Rest Centre but the majority were able to find accommodation for the night with friends or relatives. Social Services arranged accommodation for the remainder. Rossendale Raynet was stood down at 22.08 when the Rest Centre closed for the night.

Im G4NJH in Nottingham.

--

There were no injuries reported and the ham radio system worked flawlessly. (GB2RS)

**

ENFORCEMENT: FCC INVESTIGATING 1999 EXAM SESSIONS

The FCC has ordered thirty-seven hams to sit for retests. This, as part of an ongoing investigation of ham radio examination sessions held in Yucaipa, California, back in 1999.

The tests under government scrutiny were administered by a W5YI exam team. The exact test dates involved are those held on February 27th, March 27th, April 24th, May 22nd, June 26th, and July 31st of 1999.

This is one of the largest retest orders issued since the all volunteer testing program got underway in the early 1980's. (FCC)

**

ENFORCEMENT: HAM SURRENDERS LICENSE

A now former ham involved in a licensing investigation has turned in his ticket to the FCC. The Agency's Daryl Duckworth, NN0W, explains:

--

Frank C. Richards of Moers, New York, submitted his license KG2IJ for cancellation. In November of 1995 he had requested that the call sign KB4VU be changed to the next availlable and that the address be changed to Plattsburg, New York.

--

The FCC says that the call KB4VU actually belongs to one Frank C. Richards of Ft,. Meyers, Florida. It says that this Richards has never lived in New York and never requested that his callsign or address be changed.

After an investigation that lasted almost five months the New York Richards surrendered his ticket to the FCC on June 23rd. The FCC acknowledged receipt on July 6th noting that the Wireless Telecommunications Bureau has canceled that license and no further enforcement action is contemplated at this time. (FCC, RAIN)

**

ENFORCEMENT: $11,000 FINE AFFIRMED AGAINST CALIFORNIA HAM

The FCC has affirmed an $11,000 fine issued to a California ham. One whom the agency says caused deliberate interference to repeaters and then refused to accept several certified letters from the Commission.

The target of the now affirmed fine is Daniel Granda, KA6VHC, of Whittier California. As previously reported, back on March 31st the District Director of the Commission's Los Angeles Field Office issued a Notice of Apparent Liability for Forfeiture alleging that Granda deliberately interfered with two different repeaters. It said that when FCC notices were sent by Certified Mail, they were returned as unclaimed. But the FCC says that copies sent by regular first-class mail were not returned by the post office.

The fine is $7,000 for the alleged interference and $4,000 for not responding to FCC notices. Granda was given the usual 30 days to pay or to file an appeal. (FCC)

**

HAMVENTION: ARRL NATIONAL AND HAMVENTION COMBINE FOR 2005

Turning to the ham radio social scene, word that the ARRL has accepted an invitation from planners of Hamvention 2005 to bring the society's national convention back to Dayton.

According to General Chairman Gary Des Combes, N8EMO, ARRL Great Lakes Director Jim Weaver, K8JE, called shortly after the recent Board of Director's meeting. Weaver told Des Combes the League had accepted the invitation to hold the next ARRL National Convention at the 2005 Dayton Hamvention.

The combined show will take place next May 20th to the 22nd at its longtime home. That of coarse is the Hara Arena in suburban Dayton. (Hamvention©)

**

CONVENTIONS: K7UGA ON THE AIR FROM ARRL SW DIV CON

And the call sign of the late Barry M. Goldwater will soon be heard again. This, as special events station K7UGA takes to the air from the Southwestern Division Convention in Phoenix, Arizona from August 27th to the 29th.

This will not only be a chance for convention attendees to operate Goldwater's original Collins S-Line equipment but also to take part in an oral history project about Senator Goldwater that will begin recording at the show. Also, Goldwater impersonator Ben Tyler will attend the convention on Saturday afternoon to present his Goldwater "Autobiography".

Again. it all takes place August 27th to the 29th in Phoenix, Arizona. We will see you there. (SW Division Communicator)

ARNEWSLINE™ SUPPORT FUND REPORT WITH N6TCQ

Ladies and gentlemen, once again here is Amateur Radio Newsline's Support Fund Administrator, Andy Jarema, N6TCQ.

--

Continuing with our thank-you for June, we heard from Tim, N9TO and Carol Toman, WD9CNW of Westmont, IL; Ted Tsucalas, W0RMJ of Littleton, CO; Turning to CA, Leo Halog, KR6EG of San Francisco; Doug Cannon of Livermore; Monthly contributor William Walters, WA2IBM, of San Jose; monthly contributor Scott Hensley of the Area Communications Team, also in San Jose; Art Protas, KG6AY of West Covina; John Rice, KE6YFV of San Pedro and the Rio Hondo ARC of Whittier.

Thank you to everyone, and we promise to do our best to continue to earn your care and support.

A reminder that Newsline is a 501(c)(3) and California non-profit corporation. FCC regulations prohibit us from telling you exactly how to support us, but that information is on our website at www.arnewsline.org. That address will be repeated at the end of the newscast.

I'm Andy Jarema, N6TCQ.

--

Thank you Andy. (ARNewsline™ Support Fund)

**

CHANGING OF THE GUARD: JOHN KRAUS, W8JK - SK

Some sad news to report. Word that noted astronomer and antenna designer John Kraus, W8JK, has become a Silent Key. According to reports from the ARRL and CQ Magazine, Kraus died on July 18 at age

John Krasus was a member of the inaugural "class" of the CQ Amateur Radio Hall of Fame, a world-renowned radio astronomer and the father of the "Big Ear" radio telescope at Ohio State University. In the world of Amateur Radio he was perhaps best known as an antenna designer. His designs include the famous W8JK bi-directional wire beam as well as the helix and corner reflector antennas often used at UHF frequencies. (ARRL, CQ)

**

KAHN STILL TRYING TO TEST CAM-D

Broadcast entrepreneur Leonard Kahn opposes the AM HD Radio IBOC system and has long promoted his Cam-D system as an alternative. In his latest filing with the FCC for the IBOC proceeding, Kahn reveals he tested his Cam-D system on Nebraska's 50 kilowatt KRVN at 880 kHz. However, he told Radio World Online that, some employees found the sound unacceptable and the tests were discontinued. For more on this story, see http://www.rwonline.com/dailynews/one.php?id=5511 (CGC)

**

HAM RADIO IN SPACE: NEW KENWOOD ISS RADIO PROVES OUT FINE

The Amateur Radio on the International Space Station USA team has successfully completed a comprehensive checkout pass of the new Kenwood D700 radio system with Astronaut Mike Finke, KE5AIT. Utilizing ground stations in Greenbelt, Maryland, Orlando, Florida and Houston, Texas and linking team members in Kansas, Colorado, Maryland, Florida and Texas, the ARISS USA team performed voice and packet radio uplink tests to fully validate the Kenwood D700 system for future school group operations.

During the East Coast pass, the ARISS team were able to perform signal strength measurements and voice quality checks on 2 meters and 70 centimeters using the Kenwood D700 radio and the ARISS-built W A One antenna system. Mike Finke provided the on-board feedback to the team to help them understand how the radio sounds on-orbit. Finke said that the signals from the 70 centimeter uplink signals were especially loud. (ARISS)

**

WORLDBEAT - CANADA: RESTRUCTURING ON ITS WAY

Back on Earth, Canada appears ready to restructure its Amateur Radio service and work is well underway.

Following extensive discussions with Industry Canada, on July 23rd, Radio Amateurs of Canada formally submitted its Proposal on Morse Code and Related Matters to that regulatory agency. According to an Radio Amateurs of Canada press release, little changed from the draft proposal that was posted on the society's web site back in 2003.

Radio Amateurs of Canada says that it is now up to Industry Canada to respond to the proposal. The current version is on line in both English and French at www.rac.ca (RAC)

**

WORLDBEAT - MEXICO: ALL N.A. ADOPTS U.S. HDTV STANDARD

Mexico has formally adopted the U.S. ATSC Digital Television Standard based on 8 VSB technology. This, for terrestrial broadcasting in that nation.

Canada adopted the same standard in 1997. The decision by Mexico to go along with the U-S and Canada means that ATSC is now the North American Digital Television standard. ATSC was also adopted by South Korea in November of 1997 and Argentina in October of 1998. More is on the web at http://www.atsc.org/news_information/press/2004/PR_Mexico_7-7-4.pdf (CGC)

**

DX

In D-X, word that husband and wife team EA3BT and EA3WL will be active from the Gambia through the 4th of August. They plan to operate as C56BT and C56WL on 40 to 6 meters SSB. QSL as directed on the air.

And Steve Burrows, M5BXB, will be on from the Czech republic as OK8XB until the 6th of August. The OK8 prefix is quite rare, and Steve will be attempting to make at least 1,000 QSOs on the HF, 6 meters and on 2 meter's from a portable location on Lysa Hora. Thats site is 1,324 metres above sea level in grid square JN99FN.

**

THAT FINAL ITEM: THE PHYSICS OF M&M'S

And finally this week the story of how a researcher with a sweet tooth has changed science. Amateur Radio Newsline Henry Feinberg, K2SSQ, has the rest of the story:

--

Princeton physicist Paul Chaikin's passion for M&M candies was so well known that his students played a sweet practical joke on him. The left a 55 gallon drum of the candies in his office. Little did they know that their prank would lead to a physics breakthrough.

The journal Science says that the barrel full of the oblate little candies made Chaikin think about how well they packed in. A series of studies have shown they pack more tightly than perfect spheres. This is something that surprises many physicists and Chaikin himself. So Chaikin and his colleague, chemist Salvatore Torquato, used the candies to investigate the physical and mathematical principles involved when particles are poured randomly into a vessel.

The report in Science says they found that oblate spheroids like plain M&Ms pack surprisingly more densely than regular spheres when poured randomly and shaken. That spheres occupy about 64 percent of the space in a container. M&Ms manage to pack in at a density of about 68 percent.

But one of the researchers had a more philosophical view of the experiment. Salvatore Torquato said that to him it is remarkable that you an take this simple system with common candies and probe one of the deepest problems in condensed matter physics.

For the Amateur Radio Newsline, I'm Henry Feinberg, K2SSQ, not to far from Princeton, New Jersey.

--

According to news reports, Mars Inc., which makes M&Ms, did not help sponsor the research although it donated 125 pounds of M&Ms to the two scientists. (Journal of Science, Science Online)

Paul

I used to think I could do alot of things with Smith Charts and Z theta Charts.   I'm way out of practice, but might be able (and willing) to point you to where you can solve the problem you now have.

Since I am not smart enough to see *exactly* whats involved with S and Y in your post, I may be off base with this. --   Are you aware that the admittance of an impedance can be identified by overlaying a transparent Smith Chart over another Smith Chart with "zero" impedance overlaid on "infinite" impedance.

Jerry

It's been a long time since I've used a Smith Chart, but the overlay
method is what I seem to remember as well.

Jim

I'm kinda embarressed to admit that I'm not even sure what Y and S refers to. I do remember that impedances plotted on a Smith Chart will follow the lines of constant "conductance" on the transparent overlay. Maybe thats too fundamental for inclusion in this thread. But, it sure is a quick way of predicting how much shunt Xl or Xc is needed to "tune" to a more desireable impedance.

Jerry

Yup and you can get one with the admittance chart already overlaid
on the impedance chart. any point plotted can be read either way and
the s-params are also directly read from either with dividers or a
ruler.

I have no clue why Paul is converting between rectangular and polar
and replotting. The point should stay put.

Indeed. And that is something I've considered. But The way Bowick
explains it, it *ought* to be possible to perform the conversion
summarily by a simple graphical method. Unfortunately, the
arithmetical method he describes only works for linear polar charts,
which of course the SC certainly isn't linear!
And the guy who suggested the 180' rotation: I reckon that's *part* of
the solution, but simply doing this alone merely converts impedances
to admittances. S-params are typically denoted in the form x+/-yj
whereas the Y-params are denoted as vector and angular co-ordinates,
so further mappings and/or translations are required following any
rotation...
Still, I'm sure someone out there will know. :-/

Paul

I realize that I dont understand what needs to be done.   I'm just too far out of touch with technology.   But, is there any chance that a Ztheta Chart overlay would be of any assistance??   Properly used, the combination of Smith and Ztheta can be a usefull tool. That overlay provides the impedance magnitude with its angle, at a glance, for all R+/- j X.

Jerry, I appreciate your tip. But that's not actually what I'm trying
to ascertain. The complete SC is hard enough to read as it is without
overlaying a spherical grid on it! Your idea might well work, don't
get me wrong, but I just need to know if S-Y mappings can be carried
out with the Smith Chart *alone.*

Thanks,

Paul

Semiconductor s-params are usually listed as magnitude and angle, with
the mag sometimes in pure scalar form, or sometimes in dB. A universal
conversion program would be nice, espacially if it included equivalent
reactance, capacitance, inductance, stuff like that.

I sense some confusion about s and y parameters. S parameters aren't impedances -- they're dimensionless transmission or reflection coefficients. They do have a real and imaginary part (or magnitude and angle) like an impedance, but that's as far as the similarity goes. You can overlay a Smith chart on a polar plot of reflection coefficient (e.g., s11) and directly read the normalized impedance which causes that reflection coefficient. But what you read from the Smith chart isn't the the reflection coefficient -- that is, it's not the s parameter. When you reverse the Smith chart, you get the admittance causing the reflection coefficient, but this still isn't a y parameter. If you invert an s parameter, you still have a dimensionless number.

Y (admittance) parameters are a different critter, are measured differently than s parameters, and have the dimensions of admittance. Transformation from s to y or vice-versa isn't simple. For example,

y11 = {[(1 - s11)(1 + s22) + s12s21] / [(1 + s11)(1 + s22) - s12s21]}/Z0

(See, for example, Gonzalez, _Microwave Transistor Amplifiers, Analysis and Design_.) From this you can see that in order to find y11, you not only have to know s11, but also s12, s21, and s22. So it's simply not possible to convert from y11 to s11 if s11 is all you know.

The same question crossed my mind right after is posted a reply to the "how do you measure impedance" question.

Yes, of course, anyone holding a General Class or better ticket should know this. At the time I took my test with the FCC in the Customs House in Philadelphia, many of the questiones were conditioned on your ability to not only comprehend, but to compute impedance. The Commecial 1st Class Radiotelephone exam that I took several weeks later expanded slightly on impedance computations, more lingering on things how how many tube spares were reqired by commercial radio stations, however they still required the applicant to demonstrate that he was sufficiently skilled in impedance vector computations. (The FCC inspectors at that time carefully inspected my slide-rule, making sure that it was a standard K&E or other manufactures model off-the-shelf, and that it didn't include any other aids.)

I too wonder what has become of licensing requiredments, and also have to wonder about what happens to the integrity of the exams when they are administered by anyone other than the FCC itself.

Harry C.

Paul

I just now learned about S and Y parameters. I learned that they are WAY too complex for me to understand. I think it *is* time for me to apologize for commenting when I could have been more help by remaining silent.

Jerry

Bullshit. it's magnitude and angle. You plot Z = R + jX on the
friggin chart and measure the distance from the origin to get
magnitude. You measure the angle to get.. angle. Imagine that.

If you do mag = sqrt(R^2 + X^2) and angle = atan(X/R) and plot it,
you'll see that no conversion was necessary at all.

> whereas the Y-params are denoted as vector and angular co-ordinates,

More BS.

Roy,

Thanks for another well informed and sensible reply.

Paul,

Why limit yourself to going from S to Y parameters. Might as well go for H and Z parameters too.

If possible, find yourself a copy of HP Application Note 154, April, 1972 "S-Parameter Design". In the first few paragraphs they point out that H, Y, and Z parameters are defined by voltages and currents.

Quoting:

"The important thing to note here is that both open and short circuits are essential for making these measurements.

Moving to higher and higher frequencies, some problems arise:
1. Equipment is not readily available to measure total voltage and total current at the ports of the network.
2. Short and open circuits are difficult to achieve over a broad band of frequencies.
3. Active devices, such as transistors and tunnel diodes, very often will not be short or open circuit stable."

So, since the 60's, RF designers have been using S-parameters to characterize devices and circuits. They are based on reflection and transmission in a 50 ohm system. They are measurable. Why do you feel you want to use Y parameters? (Why-oh Y-oh?)

I read in sci.electronics.design that Paul Burridge <pb@notthisbit.osiris1.co.uk> wrote (in <k2flg05dg83q9vhr08gphfq95lfs9p3f71@4ax.com>) about 'S - Y Parameter conversion with Smith Chart', on Fri, 30 Jul 2004:
>S-params are typically
>denoted in the form x+/-yj whereas the Y-params are denoted as vector
>and angular co-ordinates, so further mappings and/or translations are
>required following any rotation...

I don't know which way you want to convert, but the conversion from magnitude and angle to complex Cartesian co-ordinates is:

x = mag*cos(angle), y = mag*sin(angle)

Be careful of the signs of sin and cos if angle is negative. sin is negative and cos is positive. You can see this if you draw a simple diagram of x and y axes.

To convert the other way,

mag = sqrt(x^2 + y^2), angle =arctan(y/x).

This isn't difficult mathematics in these days of scientific calculators, but you do need to be careful about signs, AND check that the result is credible: if it isn't, you probably made a keying error.

For example, when you calculate angle, then calculate its sin and cos, to check with the original data.

>you want to use Y parameters? (Why-oh Y-oh?)

I agree entirely, Rex. I'd much sooner use scattering parameters alone
for the reasons given in your post. The only flY in the ointment is
that some datasheets only provide Y-params and when those times arise
one needs to be able to convert between the two. Now it transpires
from what Roy has stated that there is no feasible way to convert the
two using the Smith Chart. That's fine; at least I know I'm not doing
all that mathematical manipulation unnecessarily. John L's suggestion
of writing a routine to do the fiddly bits now seems the most likely
solution. Should only take about a line-and-a-half of C++.
Thanks, both.

I *have* done the maths and plotted it. That's the whole point of the
original question. I can only assume you didn't understand the
original point or else you're incapable of expressing yourself
clearly. If you don't have anything useful to contribute to the
threads I start then I'd be grateful if you just kept your views to
yourself. There was a time when I valued your input but it seems those
days are over.
'Bye, Mike.

I read in sci.electronics.design that Jerry Martes <j.jmartes@verizon.net> wrote (in <fcCOc.467$Je5.431@nwrddc03.gnilink.net>) about 'S - Y Parameter conversion with Smith Chart', on Sat, 31 Jul 2004:
> I just now learned about S and Y parameters. I learned that they are
>WAY too complex for me to understand. I think it *is* time for me to
>apologize for commenting when I could have been more help by remaining
>silent.

I suspect that in fact they aren't too complex for you to understand. There are lots of over-complicated explanations around. The Y (admittance) parameters relate the input and output currents to the input and output voltages, using the basic equation (Ohm's Law V = IR inverted) I = VY.

Because there is internal feedback and feed-forward inside the transistor, the output voltage has an (unwanted, usually) effect on the input current and the input voltage has a wanted effect on the output current. For this we get two not very difficult equations:

Iin = VinYin + VoutYfeedback

Iout = Vin Yfeedforward + VoutYout

The suffixes are often replaced by two numbers, where 1 means input and 2 means output.

I in = I1, Vin = V1, Iout = I2, Vout = V2.

Yin = Y11, Yfeedback = Y12, Yfeedforward = Y21, Yout = Y22.

S parameters deal with how well the input and output impedances match a specified characteristic impedance, usually 50 ohms, and are based on incident and reflected powers.

In the general case, the possibility appears to be allowed of applying power at the output as well as, or instead of, the input. Normally, of course, this isn't the case; the 'output power' flows out of the device and is what you want!

Pina is the power applied to the input and Pinr is the power reflected (if the input impedance doesn't match the chosen characteristic impedance). Pouta is the power produced (or applied) at the output and Poutr is the reflected power at the output (if there is a mismatch).

Using the numbers 1 and 2 as explained above:

Pinr = S11Pina + S12Pouta

Poutr = S21Pina + S22Pouta

Again, these are not very difficult. However, some of the calculations using them can be a bit more complicated, but don't use any mathematical concepts more advanced that square roots, sin, cos and tan, and x + jy.

There is a paper in Electronics, October 16 1967, 'Quick amplifier design with scattering parameters' by William H Froehner (then of TI), which gives a lot of useful information, and a reference to a previous, simpler paper. I only have a monochrome photocopy, and some of the diagrams use colour, but it may be possible to retrieve the original through a library service.

It might be nice, but it's dumbing down the subject, and anyone using s-parameters for real had better *understand* what he/she is doing,
otherwise any success would be a pure fluke.

rec.radio.amateur.antenna:4430 sci.electronics.design:19937

I read in sci.electronics.design that Roy Lewallen <w7el@eznec.com> wrote (in <10glmf6regc7re4@corp.supernews.com>) about 'S - Y Parameter conversion with Smith Chart', on Fri, 30 Jul 2004:

>Transformation from s to y or vice-versa isn't simple. For example,
>
>y11 = {[(1 - s11)(1 + s22) + s12s21] / [(1 + s11)(1 + s22) - s12s21]}/Z0

It doesn't look too simple written in ASCII, but it only uses addition, subtraction, multiplication and division, with brackets [1]. It's a bit easier to understand if you get rid of the double division by moving Z0 up-front, and write out the remaining division as a fraction:

```
          (1 - s11)*(1 + s22) + s12*s21
y11 = Z0* -----------------------------
          (1 + s11)*(1 + s22) - s12*s21
```

[1] OK, you need a few basics of phasor arithmetic:

If S is a phasor = magS,angleS and T is a phasor = magT, angleT, then:

S + T = (magS + magT),(angleS + angleT)

S - T = (magS - magT),(angleS - angleT)

S*T = (magS*magT),(angleS + angleT)

S/T = (magS/magT),(angleS - angleT)

To convert dBmagS in dB to magS as a number, magS = 10^(dBmagS/10). (/10
because the equations are about power, not voltage or current.
